6.5.4.1	Replacing the saddle	96
6.5.4.2	Determining saddle shape	97
6.5.4.3	Determining minimum saddle width with corrugated cardboard	98
6.5.4.4	Determining minimum saddle width with gel cushion	98
6.5.4.5	Calculating the saddle width	99
6.5.4.6	Selecting the saddle hardness	99
6.5.4.7	Adjusting the saddle hardness	99

6.5.4.8	Straighten saddle	100
6.5.4.9	Adjusting the saddle height	100
6.5.4.10	Setting the saddle height with the remote control	101
6.5.4.11	Adjusting the saddle position	102
6.5.4.12	Adjusting the saddle tilt	102
6.5.4.13	Checking saddle stability	102
6.5.5	Handlebars	102
6.5.5.1	Replace handlebars	103
6.5.5.2	Adjusting the handlebar width	103
6.5.5.3	Adjusting the hand position	103
6.5.5.4	Adjusting the handlebars	100
6.5.6	Stem	105
6.5.6.1	Replacing the handlebars	105
6.5.6.2	Adjusting the handlebar height with quick release	105
6.5.6.3	Checking the stem stability	105
6.5.6.4	Adjusting the quick release clamping force	105
6.5.6.5	Setting the quill stem	106
6.5.6.6	Adjusting the Ahead stem	106
6.5.6.7	Adjusting the angle-adjustable stem	107
6.5.7	Handles	108
6.5.7.1	Replacing the handles	108
6.5.7.2	Adjusting ergonomic handles	108
6.5.7.3	Checking handlebar stability	108
6.5.8	Tyres	109
6.5.8.1	Replacing tyres	109
6.5.8.2	Adjust tyre pressure	109
6.5.9	Brake	111
6.5.9.1	Replacing brakes	111
6.5.9.2	Retracting the brake linings	111
6.5.9.3	Change handbrake position	111
6.5.9.4	Change handbrake inclination angle	112
6.5.9.5	Determining the grip distance	112
6.5.9.6	Grip distance on SHIMANO ST-EF41 handbrake	113
6.5.10	Gear shift	114
6.5.10.1	Replacing the gear shift	114
6.5.10.2	Adjusting the SHIMANO shifter	114
6.5.11	Suspension and damping	115
6.5.12	Adjusting sag (fork)	115
6.5.12.1	Adjusting the sag for the SR SUNTOUR steel suspension fork	117
6.5.13	Riding light	118
6.5.13.1	Replacing the headlight	118
6.5.13.2	Replacing the rear light and (spoke) reflector	118
6.5.13.3	Setting the riding light	118
6.5.13.4	Adjusting the headlight	119
6.5.14	On-board computer	120
6.5.14.1	Creating a user account	120
6.5.14.2	Connecting the on-board computer to a smartphone	120
6.5.14.3	Update software	121
6.5.14.4	Activating activity tracking	121
6.5.14.5	Setting up the lock function (optional)	121
6.6	Accessories	122
6.6.1	Child seat	122
6.6.2	Trailer	123
6.6.2.1	Approval for trailer with Enviolo hub	123
6.6.2.2	Approval for trailer with ROHLOFF hub	124
6.6.3	Pannier rack	124
6.6.4	Panniers and cargo boxes	124
6.6.5	Front baskets	125
6.6.6	Bar ends	125

Thank you for your trust!

Pegasus pedelecs are premium-quality vehicles. You have made an excellent choice. Your specialist dealer will provide you with guidance and instruction and assemble your product. Your specialist dealer will also be happy to assist you in the future, whether you require maintenance, conversion or repair.

You are receiving these operating instructions with your new pedelec. Please take time to become familiar with your new pedelec and follow the tips and suggestions in the operating instructions. They will help you to enjoy your pedelec for a long time to come. We hope you have fun and wish you well on all of your rides!

Download the operating instructions onto your phone at the following link, so that you can use them when you are out riding:

https://www.pegasusbikes.de/gb-en/service/ downloads.

Copyright

© ZEG Zweirad-Einkaufs-Genossenschaft eG

Distribution or reproduction of these operating instructions and utilisation or communication of their content is prohibited unless expressly approved. Anyone who does not comply with these restrictions is liable for compensation. All rights reserved in the event that a patent, utility model or industrial design is registered.

Subject to internal changes

The information contained in these *operating instructions* are the approved technical specifications at the time of printing. In addition to the functions described here, the software may be modified at any time to rectify errors and extend functions.

Any significant changes are included in a new published version of the operating instructions. All changes and new versions of the operating instructions are published on the following website:

https://www.pegasus-bikes.de/gb-en/service/ downloads.

1 About these operating instructions

1.1 Manufacturer

ZEG Zweirad-Einkaufs-Genossenschaft eG Longericher Strasse 2 50739 Köln, Germany

Tel.:+49 221 17959 0Fax:+49 221 17959 31Email:info@zeg.de

1.2 Laws, standards and directives

The *operating instructions* comply with the essential requirements specified in:

- Machinery Directive 2006/42/EC
- Electromagnetic Compatibility Directive 2014/30/ EU
- ISO 20607:2018 Safety of machinery Instruction handbook – General drafting principles
- EN 15194:2018 Cycles Electrically power assisted cycles pedelec bicycles
- EN 11243:2016 Cycles Pannier racks for bicycles – Requirements and test methods
- ISO 17100:2016-05 Translation Services Requirements for translation services.

1.3 Language

The original operating instructions are written in German. A translation is invalid without the original operating instructions.

1.4 For your information

Different markings are used in the operating instructions to make them easier to read.

ß	Text for specialist dealers
[m]	Notice on replacing components
	Notice on fitness

1.4.1 Warnings

Warnings indicate hazardous situations and actions. You will find three categories of warnings in the operating instructions:

WARNING

May lead to serious or even fatal injuries if ignored. Medium-risk hazard.

May lead to minor or moderate injuries if ignored. Low-risk hazard.

Notice

May lead to material damage if ignored.

1.4.2 Markups

You will find ten text markups in the *operating instructions*:

Stylised form	Use
Italics	Glossary term, first mention in section
Underlined in blue	Link
Underlined in grey	Cross references
\checkmark	Requirements
•	Instructions for actions without specific order
3	Instructions for actions in specified order
\$	Result of the action
SPACED	Indicators on the display screen
•	Bulleted lists
Only applies to pedelecs with this equipment	A note beneath the heading indicates components which can be used as an option

Table 1: Markups

1.5 Aim of the operating instructions

These operating instructions are not a substitute for personal instruction by the specialist dealer supplying the bike. These operating instructions are an integral part of the pedelec. Therefore, if it is re-sold at a later time, they must be handed over to the subsequent owner.

These operating instructions are mainly written for people riding pedelecs.

Paragraphs with a white background are intended to enable non-professionals to make safe settings on the pedelec, use it, clean it and identify and eliminate any faults.

G Sections intended for technical staff are highlighted in blue and marked with a spanner symbol.

These sections aim to allow trained technical staff (bicycle mechatronics engineers, bicycle mechanics or others) to carry out initial assembly, adjustment, inspection and repair safely.

Technical staff also need to read all sections for pedelec riders and operators to ensure they can provide excellent customer service.

Always fill out all reports in Section 11.1 and Section 11.2 when carrying out work.

1.6 Type number and model

These operating instructions are an integral part of pedelecs with the type numbers:

Type no.	Model	Pedelec type
23-15-2072	EVO CX (Gent)	City and trekking bicycle
23-15-2073	EVO CX (Trapez)	City and trekking bicycle
23-15-2074	EVO CX (Wave)	City and trekking bicycle

Table 3: Type number, model and pedelec type

1.7 Frame number

Each frame has an individual frame number stamped on it (see Figure 2). The frame number can be used to associate the pedelec with the owner. The frame number is the most important identifier for verifying ownership.

1.8 Identifying the operating instructions

The operating instructions identification number is located in bottom left-hand corner of each page.

The identification number is composed of the document number, the version number and the release date.

Identification number MY23P0a - 62_1.0_26.10.2022

2 Safety

2.1 Residual risk

Pedelecs pose the following residual risks:

- Risk of fire and explosion
- Electric shock
- Risk of a crash
- Risk of amputation
- · Key breaking off
- Malfunctions due to Bluetooth®

2.1.1 Risk of fire and explosion

Never charge if there is a critical fault

If a charger is connected to the drive system when a critical error is reported, the battery may be damaged permanently and may catch fire.

 Connect charger to fault-free electric drive system only.

Protect against penetrating water

The battery is only protected from spray water. Penetration by water can cause a short circuit. The battery may self-ignite and explode.

- ▶ Never immerse battery in water.
- Take battery out of service if you suspect water has penetrated it.

Avoid heat

Temperatures over 60 °C can also cause liquid to leak from the battery and the battery will become damaged. The battery may self-ignite and explode.

- Protect the battery against heat.
- Never store next to hot objects.
- Never expose battery to continuous direct sunlight.
- Avoid wide temperature fluctuations.

Never use incorrect charger

Chargers with excessive voltage damage batteries. This may cause a fire or an explosion.

Only use approved batteries to charge.

Prevent short circuit due to interconnection

Metal objects may interconnect the battery's electrical terminals. The battery may self-ignite and explode.

- Never insert paper clips, screws, coins, keys and other small parts into the battery.
- Place the battery on clean surfaces only. Prevent charging socket and contacts against contamination from dirt, sand and similar.

Handling a damaged or faulty battery

Faulty batteries are hazardous goods. These include

- Cells or batteries which have been identified as faulty for safety reasons
- Leaked batteries or which have released gas
- Cells or batteries which have sustained external or physical damage
- Cells or batteries whose safety has not been tested yet

The safety electronics may fail if the batteries are damaged or faulty. The residual voltage can cause a short circuit. The battery may self-ignite and explode.

- Only use and charge the battery and accessories if they are in perfect condition.
- Never open or repair the battery.
- Batteries with external damage must be removed from service immediately.
- If a battery is dropped or struck, remove it from service and keep it under observation for at least 24 hours.
- Contact specialist dealer.

Storing faulty batteries

Your specialist dealer will dispose of faulty batteries.

- ► Take faulty batteries to your specialist dealer.
- Store the battery in a safety container in a dry place as per special regulations (ADR SV 376, P908) until you dispose of it.

Figure 1: Example of a safety container

- Never store near flammable substances.
- Dispose of faulty batteries in the correct manner.

Avoid overheating in the charger

The charger heats up when charging the battery. If the battery is not allowed to cool down sufficiently, it can cause a fire or burns to the hands.

- Never use charger on a highly flammable surface.
- ▶ Never cover the charger during charging.
- Never leave battery unattended during charging.

Cool down overheated brakes and motors

The brakes and the motor may become very hot during operation. There is a risk of burns or fire in case of contact.

- Never touch the brakes or the motor immediately after a ride.
- Never place the pedelec on a flammable surface, such as grass or wood, directly after use.

2.1.2 Electric shock

Never use damaged network components

Damaged chargers, cables and plug connectors increase the risk of electric shock.

Check the charger, cable and plug connector before each use. Never use a damaged charger.

Avoid water penetrating

If water penetrates into the charger, there is a risk of electric shock.

Use the charger indoors only.

Dealing with condensate

Condensation may form in the charger and in the battery when the temperature changes from cold to hot, causing a short circuit.

Wait until both charger and battery are at room temperature before connecting them.

2.1.3 Risk of a crash

Set the quick release correctly

Excessively high clamping force will damage the quick release and cause it to lose its function. Insufficient clamping force will result in unfavourable transmission of force. This can cause components to break. This will cause a crash with injuries.

- Never fasten a quick release using a tool (e.g. hammer or pliers).
- Only use the clamping lever with the specified set clamping force.

Use correct torque

If a screw is fastened too tightly, it may break. If a screw is not fastened enough, it may loosen. This will cause a crash with injuries.

Always observe the indicated tightening torque on the screw or in Section 3.4.8.

Use approved brakes only

The wheels are designed exclusively for use with rim brakes or disc brakes. The wheel may break if an incorrect brake is used. This will cause a crash with injuries.

Only use the approved brakes on the wheel.

2.1.4 Risk of amputation

The brake disc in disc brakes is so sharp that it can cause serious injuries to fingers if they are inserted into the brake disc openings.

The chain wheels and belt sprockets can draw in fingers, thus causing serious injuries to fingers.

Always keep fingers well away from rotating brake discs and the chain or belt drive.

2.1.5 Key breaking off

If you leave a key inserted when riding or transporting the pedelec, it may break off or the locking system may open accidentally.

Pull the key from the battery lock.

Safety

2.1.6 Malfunctions due to Bluetooth®

If you use the on-board computer with Bluetooth® and/or Wi-Fi®, it may cause interference with other devices, other equipment, aircraft, and medical devices, such as pacemakers and hearing aids.

Likewise, it cannot be completely ruled out that you will cause harm to people and animals in the immediate vicinity.

- Never use the pedelec with Bluetooth® when in close proximity to medical devices, filling stations, chemical plants, areas at risk of explosion and in blasting zones.
- ▶ Never use pedelec with Bluetooth® in aircraft.
- Avoid operating for longer periods in close proximity to the body.

2.2 Toxic substances

If substances are released or used which pose a risk to people and the environment, effective protective measures must be taken.

Possible hazards, contamination and health hazards due to:

- Carcinogenic, germ-cell-mutagenic and reproduction-toxic substances
- Toxic substances
- Irritants (skin, respiratory system) and corrosive substances

What might happen?

- · Serious harmful effects to health
- Threat to life
- Hazard to bystanders due to carry-over and contamination, including in personal sphere

2.2.1 Toxic substances

Toxic substances (also known as poison or toxins) refer to substances which can cause damage to living beings if they enter the organism above a specific low dose. The more the ingested amount of a toxic substance increases, the greater the likelihood of damage to health due to poisoning is. This can lead to death.

Brake fluid

Brake fluid may leak out after an accident or due to material fatigue. Brake fluid can be fatal if swallowed or inhaled.

- ▶ Never dismantle the brake system.
- Avoid contact with skin.
- Do not inhale vapours.

Irritants and corrosive substances

Corrosive substances (also known as corrosives) destroy living tissue or attack surfaces. Corrosive substances may be in solid, liquid or gaseous form.

Irritants are hazardous substances which irritate the skin and mucous membranes once you come into contact with them. This may cause inflammation of the affected areas.

Defective battery

Liquids and vapours may leak from damaged or faulty batteries. Excessively high temperatures may also cause liquids and vapours to leak from the battery. Such liquids and vapours can irritate the airways and cause burns.

- Never dismantle the battery.
- Avoid contact with skin.
- ► Never inhale vapours.

2.3 Requirements for the rider

The rider must have adequate physical, motor and mental abilities to ride on public roads. A minimum age of 14 years is recommended.

2.4 Vulnerable groups

- Keep batteries and the charger away from children and people with reduced physical, sensory or mental capacities or lacking in experience and knowledge.
- Children and young people must be provided with comprehensive instructions by a legal guardian.

2.5 Personal protective equipment

- Wear a suitable helmet. The helmet must have a reflective strip or a light in a clearly visible colour.
- ► Wear sturdy shoes.
- Wear clothing which is as bright or retroreflective as possible. Fluorescent materials are also suitable. High-visibility jackets and straps on your upper body ensure even greater safety. Never wear a skirt. Always wear trousers which reach down to your ankles instead.
- ▶ Wear gloves when it is cold.

2.6 Safety guards

Three safety guards on the pedelec protect riders against heat or moving parts:

- Chain or belt guards prevent clothing from being pulled into the drive train.
- The motor cover on the motor casing protects against heat.
- Mudguards protect against dirt and water splashing up from the road.
- ► Never remove the guards.
- Check the guards on a regular basis.
- Take pedelec out of service if a guard is damaged or missing. Contact specialist dealer.

2.7 Safety markings and safety instructions

Pedelec and battery nameplates contain the following safety markings and safety instructions:

Symbol	Explanation
	General warning
ß	Adhere to the instructions for use

Table 4: Safety markings

Symbol	Explanation
	Read the instructions
	Separate collection of electrical and electronic devices
X	Separate collection of ordinary and rechargeable batteries
	Must not be thrown into fire (burning prohibited)
K	It is forbidden to open any batteries
	Device of protection class II
\bigcirc	Only suitable for use indoors
-=	Fuse (device fuse)
CE	EU conformity
	Recyclable material
Res SUC	Protect from temperatures above 50 °C and direct sunlight

Table 5: Safety instructions

2.8 What to do in an emergency

2.8.1 Dangerous situation in road traffic

If you encounter any hazards or dangers in road traffic, apply the brake on the pedelec until it comes to a halt. The brake acts as an emergency stop system in such cases.

2.8.2 Leaked brake fluid

- Remove those affected from the danger area to fresh air.
- ► Never leave those affected unattended.
- Immediately remove any clothing items contaminated with brake fluid.
- Never inhale vapours. Ensure sufficient ventilation.
- Wear gloves and safety gloves as protective equipment.
- ► Keep unprotected persons away.
- Take care with leaked brake fluid as it poses a slip hazard.
- Keep leaked brake fluid away from naked flames, hot surfaces and sources of ignition.
- ► Avoid contact with skin and eyes.

If inhaled

- 1 Take in fresh air.
- 2 Immediately consult a doctor in case of any discomfort.

After skin contact

- 1 Wash affected skin with soap and water and rinse well.
- **2** Remove contaminated clothing.
- **3** Consult doctor in the event of pain or discomfort.

After contact with eyes

- 1 Rinse eyes under flowing water for at least ten minutes with the lids open; also rinse under lids.
- **2** Immediately consult a doctor in case of any pain or discomfort.

If swallowed

- 1 Rinse out mouth with water. Never induce vomiting. Risk of aspiration.
- **2** If a person is lying on their back and vomiting, place them in the recovery position.
- 3 Seek medical advice immediately.

Environmental protection measures

- Never allow brake fluid to flow into sewage, water courses or groundwater.
- Notify the relevant authorities if fluid penetrates the ground, water courses or the sewage system.
- Dispose of leaked brake fluid in an environmentally responsible way in accordance with statutory regulations (see Section 10.1).
- The brake system must be repaired immediately if brake fluid leaks out. Contact specialist dealer.

2.8.3 Battery vapour emission

Vapours may be emitted if the battery is damaged or used improperly. The vapours may cause respiratory tract irritation.

- 1 Get into fresh air.
- 2 Consult doctor in the event of pain or discomfort.

After contact with eyes

- 1 Carefully rinse eyes with plenty of water for at least 15 minutes. Protect unaffected eye.
- 2 Seek medical advice immediately.

After skin contact

- 1 Remove any solid particles immediately.
- 2 Remove contaminated clothing immediately.
- 3 Rinse the affected area with plenty of water for at least 15 minutes.
- **4** Then dab the affected skin gently. Do not rub dry.
- **5** Immediately consult a doctor if there is any redness, pain or discomfort.

2.8.4 Battery fire

The safety electronics may fail if the battery is damaged or faulty. The residual voltage can cause a short circuit. The battery may self-ignite and explode.

- 1 Keep your distance if the battery becomes deformed or starts to emit smoke.
- 2 If charging, remove the plug connector from the socket.
- 3 Contact the fire service immediately.
- ▶ Use Class fire extinguishers to put out the fire.
- Never extinguish damaged batteries with water or allow them to come into contact with water.

Inhaling vapours can cause intoxication.

- Stand on the side of the fire where the wind is blowing from.
- ▶ Use breathing apparatus if possible.

2.9 Data privacy information

When the pedelec is connected to the diagnosis tool at the specialist dealer's, data is transferred to BOSCH eBike Systems (Robert Bosch GmbH) on the use of the Bosch drive unit, including its energy consumption and temperature, to help improve the product.

You will find more information on the Bosch eBike website:

www.bosch-ebike.com.

3 Description

3.1 Proper use

All checklists and instructions for actions in these operating instructions met. Approved accessories can be installed by specialist staff.

Use the pedelec when it is in perfect, proper working order only. National requirements may apply to the pedelec which the standard equipment may not meet. Different regulations apply across the country to the riding light,

3.1.1 Pedelec type

Each pedelec is assigned a pedelec type, which determines its proper use, function and area of use.

3.1.2 Improper use

Failure to adhere to the proper use poses a risk of personal injury and material damage. It is prohibited to use the pedelec in the following ways:

- when the electrical drive system been manipulated
- changing, eliminating or effacing frame numbers, nameplates or component serial numbers, or manipulating them in any other way
- riding with a damaged or incomplete pedelec
- riding over steps
- · riding through deep water
- charging with an incorrect charger
- · lending the pedelec to untrained pedelec rider
- carrying other people
- riding with excessive baggage

reflectors and other components when riding on public roads. The general laws and the regulations for the prevention of accidents and environmental protection in the respective country of use must be adhered to.

The rechargeable batteries are designed to supply power to the pedelec motor only. Never use the batteries for other purposes.

City and trekking bicycle

City and trekking bicycles are designed for comfortable, daily use and are suitable for riding on public roads.

Table 6: Proper use

- riding with no hands
- · riding on ice and snow
- improper servicing
- · improper repair
- tough areas of use, such as professional competitions
- acrobatics, riding up ramps, stunt riding or flying stunts.

City and trekking bicycle

City and trekking bicycles are not sports bicycles. If used for sports, the rider can expect reduced riding stability and diminished comfort.

Table 7: Improper use

3.1.3 Maximum permitted total weight (PTW)

The pedelec may only be loaded to its *maximum permitted total weight* (PTW).

The maximum permitted total weight is

- the weight of the fully assembled pedelec
- plus body weight
- plus baggage

Type no.	Model	PTW [kg]
23-15-2072	EVO CX (Gent)	135
23-15-2073	EVO CX (Trapez)	135
23-15-2074	EVO CX (Wave)	135

Table 8: Type number, model and PTW

3.1.4 Environmental requirements

You can be ride the pedelec within a temperature range between -5 °C and +40 °C. The electric drive system is limited in its performance outside this temperature range.

Operating temperature

-5 ... +40 °C

During winter use, especially at temperatures below 0 °C, we recommend that you don't insert a battery charged and stored at room temperature into the pedelec until just before setting off. We recommend using thermal protection sleeves when riding longer distances at low temperatures. Temperatures under -10 °C and over +60 °C must be avoided as a general rule. Never put the battery in a car in summer or store it in direct sunlight.

You must also keep within the following temperature ranges:

Transportation temperature	+10 +40 °C
Storage temperature	+10 +40 °C
Work environment temperature	+15 +25 °C
Charging temperature	+10 +40 °C

The nameplate contains symbols for the pedelec's area of use.

Check what tracks and roads you may ride on before setting off for the first time.

Area of use	City and trekking bicycles	Child's bicycles/ bicycles for young adults	Mountain bikes	Racing bicycle	Cargo bike	Folding bicycle
		A S		A		a de la compañía de la
1	Suitable for tarmacked and paved roads.	Suitable for tarmacked and paved roads.		Suitable for tarmacked and paved roads.	Suitable for tarmacked and paved roads.	Suitable for tarmacked and paved roads.
2	Suitable for tarmacked roads, cycle paths, firm gravel paths and roads, and longer sections with moderate slopes and jumps up to 15 cm.	Suitable for tarmacked roads, cycle paths, firm gravel paths and roads, and longer sections with moderate slopes and jumps up to 15 cm.	Suitable for tarmacked roads, cycle paths, firm gravel paths and roads, and longer sections with moderate slopes and jumps up to 15 cm.	Suitable for tarmacked roads, cycle paths, firm gravel paths and roads, and longer sections with moderate slopes and jumps up to 15 cm.		
23		Suitable for tarmacked roads, cycle paths and easy to demanding off- road riding, sections with moderate slopes and jumps up to 61 cm.	Suitable for tarmacked roads, cycle paths and easy to demanding off- road riding, sections with moderate slopes and jumps up to 61 cm.			
 4			Suitable for tarmacked roads, cycle paths and easy to demanding off- road riding, limited downhill use and jumps up to 122 cm.			

3.1.5 Area of use

Table 9: Area of use

The pedelec is unsuitable for the following areas of use:

Area of use	City and trekking bicycles	Child's bicycles/ bicycles for young adults	Mountain bikes	Racing bicycle	Cargo bike	Folding bicycle
	B	A State		S		A
1	Never drive off- road or perform jumps.	Never drive off- road or perform jumps.		Never drive off- road or perform jumps.	Never drive off- road or perform jumps.	Never drive off- road or perform jumps.
2	Never drive off- road or perform jumps over 15 cm.	Never drive off- road or perform jumps over 15 cm.	Never drive off- road or perform jumps over 15 cm.	Never drive off- road or perform jumps over 15 cm.		
~ 3		Never ride downhill or perform jumps over 61 cm.	Never ride downhill or perform jumps over 61 cm.			
4			Never traverse extremely difficult off-road terrain or perform jumps over 122 cm.			

Table 10: Unsuitable terrain

3.2 Nameplate

The nameplate is situated on the frame. The precise position of the nameplate is shown in Figure $\underline{3}$.

The nameplate contains up to twelve pieces of information.

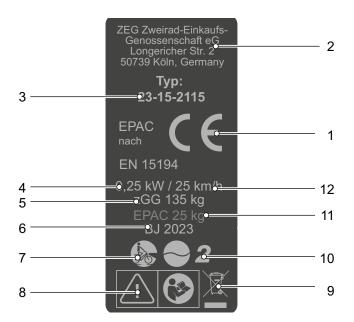

Figure 2: Example ZEG nameplate

No.	Designation	Description	More information
1	CE marking	The manufacturer uses the CE marking to declare that the pedelec complies with applicable requirements.	
2	<u>Manufacturer</u>	You can contact the manufacturer at the address indicated.	Section <u>1.1</u>
3	Type number	All pedelec models have an eight-digit type number, which is used to specify the design model year, the type of pedelec and the version.	Section <u>1.6</u>
4	Maximum continuous power rating	The maximum continuous power rating is the greatest possible power for the electric motor output shaft over 30 minutes.	
5	Maximum permitted total weight (PTW)	The maximum permitted total weight is the weight of the fully assembled pedelec with the body weight plus the baggage.	Section 3.1.3
6	Year of manufacture	The year of manufacture is the year in which the pedelec was manufactured.	
7	Pedelec type	Each pedelec is assigned a pedelec type, which determines its proper use, function and area of use.	Section 3.1.1
8	Safety markings and safety instructions	Safety markings warn of hazards.	Section 2.7
9	Disposal instructions	Follow the guidelines on waste disposal when disposing of the pedelec.	Section <u>10.1</u>
10	Area of use for city and trekking bikes	Ride pedelec in permitted locations only.	Section 3.1.5
11	Weight of the ready-to-ride pedelec (optional; only for pedelecs 25 kg or more)	The weight of the ready-to-ride pedelec is specified as a weight of 25 kg or above and refers to its weight at the time of purchase. Any extra accessories need to be added to the weight.	Section <u>4.1</u>
12	Shut-off speed	The speed that the pedelec reaches at the moment when the current has dropped to zero or to the no-load current value.	

Tabelle 11: Explanation of information on the nameplate

3.3.2 Chassis

The chassis comprises two components:

- · Frame and
- steering system

3.3.2.1 Frame

The frame absorbs all forces which act on pedelec from body weight, pedalling and the ground. The frame also acts as a carrier for most components.

The frame geometry determines the pedelec's ride performance. A frame comprises the following elements:

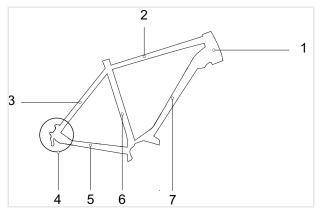

Figure 4: Elements of the frame

- 1 Head tube
- 2 Top tube
- 3 Rear frame seat stay
- 4 Rear frame fork end
- 5 Chain stay
- 6 Seat tube
- 7 Down tube

The size of the frame must be adjusted to the rider's height.

Frame size for city and trekking bicycle, folding bicycle and cargo bike

The tolerance for the frame height and its associated top tube length is somewhat greater for city bicycles due to the more upright riding position. As the handlebars and saddle can be adjusted to the rider's height, the range of recommended frame sizes can be somewhat wider.

Rider's height [cm]	Frame size [cm]	
155 165	S	43 48
165 175	М	48 53
175 185	L	53 58
185 195	XL	58 62
195 215	XXL	62 65

Table 12: Recommended frame size for city and trekking bicycles

Frame size for mountain bikes

The frame geometries for mountain bikes differ depending on the type and area of use. The frame size is not dependent on the wheel size. The differences are already taken into account in the recommended frame sizes.

Rider's height [cm]	Frame size [cm]	Wheel size [inches]
150 160	33 37	26
160 170	38 43	26, 27.5
170 180	43 47	26, 27.5, 29
180 190	47 52	26, 27.5, 29
190 200	51 56	27.5, 29
200 215	53 60	27.5, 29

Table 13: Recommended frame size for mountain bikes

Frame size for racing bicycles and gravel bikes

The different frame heights are closer together on racing bicycles and gravel bikes. Smaller increments in the frame heights ensure precise adjustment to the rider's height.

The seat on the pedelec is largely determined by the length of the top tube:

- The shorter the top tube is, the steeper the sitting position is.
- The longer the top tube is, the more stretched-out the sitting position is.

Rider's height [cm]		Frame size [cm]
160 175	XS	46 48
165 180	S	49 51

 Table 14: Recommended frame size for racing bicycles

 and gravel bikes

Frame size for bicycles for young adults

A person grows in height rapidly during adolescence. As a result, the frame size needs to be checked every six months.

Rider's height [cm]	Frame size [cm]
140 150	33 35
150 160	35 38
160 170	38 41
170 180	41 46
180 190	46 53

Table 15: Recommended frame size for bicycles for young adults, mountain bike type

Frame size for child's bike

Children are growing constantly. As a result, the frame size needs to be checked every six months.

It is important that riders, especially learners, can safely put both feet on the ground. Children thus need a pedelec that is appropriate for their height. This is the only way to ensure a safe ride.

Rider's height [cm]	Wheel size [inches]
85 110	12
90 120	16
100 125	18
110 130	20
120 145	24
135 165	26

Table 16: Recommended wheel size for child's bike

3.3.2.2 Steering system

The steering system components are:

- Steering headset,
- Stem,
- Handlebars and
- Suspension fork.

3.3.2.3 Steering headset

The steering headset (also known as a bike headset or simply a headset) is the fork bearing system in the frame. A distinction is made between two different types:

- Conventional steering headsets for fork steerers with thread and
- Steering headsets for threadless fork steerers or what are known as headsets.

3.3.2.4 Stem

The stem connects the handlebars to the fork steerer tube. The stem is used to adjust the handlebars to body size. The stem is used to adjust the handlebar height and the gap between the handlebars and saddle (see Section 6.5.6).

Quickly adjustable stems

Quickly adjustable stems are an extension to the fork steerer. You can change the height and angle of quickly adjustable stems without any tools. Up to 3 settings can be adjusted, depending on the model:

- 1 Adjust handlebar height
- 2 Adjust twist function
- 3 Adjust stem angle.

Figure 5: Example – BY.SCHULZ seat Speedlifter Twist Pro SDS

Adjusting the height and stem angle increase ride comfort as different riding positions can be adopted on longer rides. The twist function saves space when parking.

Figure 6: Twist function, using BY.SCHULZ as an example

3.3.2.5 Handlebars

The pedelec is steered using the handlebars. The handlebars are used to support the upper body and is the mount for operating and display components (see Section 3.5.1).

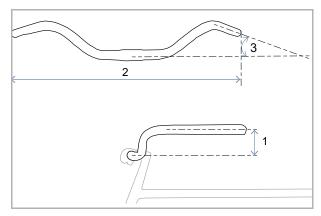

Figure 7: Handlebar dimensions

The main dimensions of handlebars are:

- 1 Rise (height)
- 2 Width
- 3 Backsweep

3.3.2.6 Suspension fork

The stem and handlebars are attached to the top end of the fork steerer. The axle is fastened to the fork ends. The wheel is fastened to the axle.

Unlike rigid forks, suspension forks improve contact with the ground and thus enhance comfort using two functions:

- Suspension and
- Damping (optional function).

The compression can be disabled in any suspension fork. A suspension fork will then behave like a rigid fork.

Suspension

A suspension fork deflects when a steel suspension, air suspension or both suspension types act on it.

The suspension in a pedelec prevents an impact, such as one caused by a stone lying in the pedelec's path, from being channelled directly into the rider's body via the fork. The impact is absorbed by the suspension system instead. This causes the suspension fork to compress.

Figure 8: Without suspension (1) and with suspension (2)

Damping

After compressing, the suspension fork returns to its original position. If there is a damper, it decelerates movement, preventing the suspension system from springing back in an uncontrolled manner and stopping the fork from vibrating up and down. A distinction is made between two types of dampers:

- Rebound dampers,
- Compression dampers.

Rebound dampers and compression dampers can be optionally divided into two different sections:

- · High-speed damper,
- Low-speed movements.

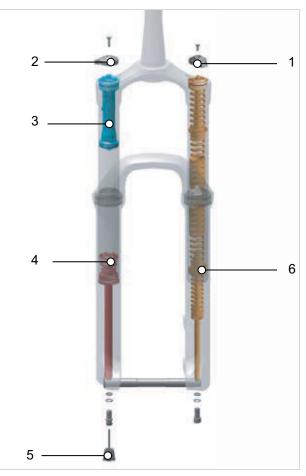

Figure 11: Internal structure of a steel spring fork

- 1 Deflection adjustment ring
- 2 Sag setting wheel
- 3 Compression dampers
- 4 Negative deflection (sag)
- 5 Rebound adjuster
- 6 Steel suspension

Cartridges

Dampers may be housed in closed structural elements, known as cartridges. These cartridges are fitted into the fork. Different cartridges can be fitted into forks. This has no effect on the fork's total bearing capacity.

Negative deflection (sag)

The negative deflection (sag) is the percentage of entire deflection that is compressed by the rider's body weight, including equipment (such as a backpack), the seating position and frame geometry. Sag occurs whether you are actually riding or not. The pedelec rebounds at a controlled speed if it is optimally adjusted. The wheel stays in contact with the ground when passing over bumps (blue line). The fork head, handlebars and body follow terrain (green line) when riding over bumps. The suspension motion is predictable and controlled.

Figure 12: Optimum fork ride performance

When optimally adjusted, the fork counteracts deflection on hilly terrain and stays higher in its deflection range.

This allows the rider to maintain the same speed more easily on hilly terrain.

Figure 13: Optimum fork ride performance on hilly terrain

When optimally adjusted, the fork deflects quickly and unhindered when the bike hits bumps and absorbs a bump. Traction is retained (blue line). The fork responds quickly to the bump. The headset and handlebars rise slightly when absorbing a bump (green line).

Figure 14: Optimum fork ride performance over bumps

Rebound dampers

Rebound dampers damp rebound movements, i.e. rebound stress loads. Rebound damping determines the speed at which the suspension rebounds after being exposed to load. Rebound damping controls the suspension fork extension and rebound speed, which, in turn, has an impact on traction and control. Rebound damping can be adjusted to body weight, spring stiffness, deflection, the terrain and the pedelec rider's preferences. If the air pressure or spring stiffness increases, the extension and rebound speeds also increase. Rebound damping needs to be increased to achieve an optimal setting if the air pressure or spring stiffness is increased. The damper rebounds at a controlled speed if the fork is optimally adjusted. The wheel stays in contact with the ground when passing over bumps (blue line). The fork head, handlebars and body follow terrain (green line) when riding over bumps. The suspension motion is predictable and controlled.

Figure 15: Optimum fork ride performance

Compression dampers

Compression dampers damp deflection movements, i.e. compression loads. The compression damper allows the rider to make quick adjustments to the suspension behaviour of the fork to adapt to changes in terrain. It is intended for adjustments made during the ride. The compression damper controls the compression lifting speed or the extent to which the fork deflects during slow impacts. The compression damper affects the absorption of bumps when weight shifts or when braking and during transitions, cornering, and uniform impacts caused by bumps. When optimally adjusted, the fork counteracts deflection on hilly terrain, stays higher in its deflection range and helps to maintain speed when riding on hilly terrain. The fork deflects quickly and unhindered and absorbs the bump when the bike hits a bump. Traction is retained (blue line).

Figure 16: Optimum ride performance on hilly terrain

High-speed damper

A high speed is generated in the suspension fork, e.g. on a mogul slope or during landing after a jump. The settings on the high-speed damper control the suspension behaviour of the fork during

- · stronger impacts
- small, rapid impacts (e.g. stairs)
- landings after quick, successive jumps.

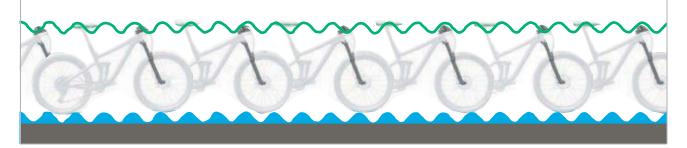

Figure 17: High-speed movements

Low-speed movements

Low-speed movement in the suspension fork is caused, for example, by riding over bumps.

The settings of the low-speed damper control the suspension behaviour of the fork

- during staggered jumps
- during shifts in the rider's weight
- when force is applied slowly.

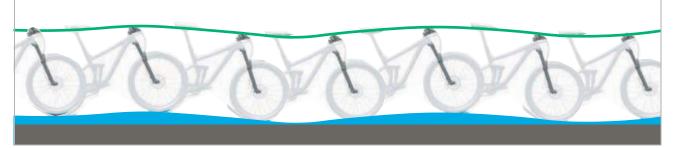

Figure 18: Low-speed movements

3.3.3 Wheel

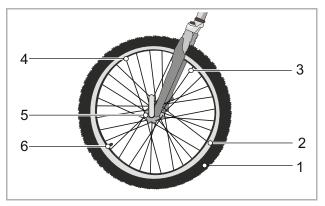

Figure 19: Visible wheel components

- 1 Tyres
- 2 Rim
- 3 Spoke
- 4 Spoke nipples
- 5 Hub
- 6 Valve

The wheel comprises a tyre, an inner tube with a valve and the wheel itself.

3.3.3.1 Tyres

The tyre forms the outer section of the wheel. The tyre is pulled onto the rim. Tyres differ in design, profile and width, depending on their intended use.

Figure 20: Example: Information on tyres

Tyre size

The tyre size pressure range is indicated on the side of the tyre.

Tyre pressure

The permitted pressure range is indicated on the side of the tyre. It is indicated in psi or bars. The tyre is only able to support the pedelec if there is adequate tyre pressure. The tyre pressure must be adjusted to the body weight and then checked on a regular basis.

Tyre design types

There are five different tyre design types:

- Tube-type tyres,
- Tubeless tyres (also tubeless ready)
- Tubular or single tube tyres
- Solid tyres
- Mixed types.

3.3.3.2 Tube-type tyre

A distinction is made between different kinds of tube-type tyre:

- Clinchers with steel wire reinforcement in bead core
- Folding tyres with aramid fibre reinforcement in bead core
- Beaded edge tyres without reinforcement in the bead core but with pronounced beads that hook under the rim edge and overlap in the rim well.

Figure 21: Structure of tube-type tyre

- 1 Rim
- 2 Tread with profile
- 3 Puncture protection belt (optional)
- 4 Carcass
- 5 Bead core

Carcass

The carcass is the tyre's supporting structure. There are usually three carcass plies beneath the tread. The carcass comprises a webbing with threads, usually made of polyamide (nylon). The webbing is coated with rubber on both sides and cut at an angle of 45°. The carcass gives the tyre stability thanks to this cut at an angle to the direction of travel. The carcass plies are woven with different densities, depending on the quality of the tyres. The density of the carcass fabric is indicated by the number of threads per inch, in EPI (*ends per inch*) or TPI (*threads per inch*). There are tyres with 20 to 127 EPI carcasses.

If the EPI value is higher, the diameter of the threads used is lower. Carcass plies with a higher EPI value have threads with a smaller diameter. The higher the EPI value:

- · the less rubber is needed to encase the threads,
- the lighter the tyres are
- the more flexible the tyres are and they consequently have less rolling resistance.
- The webbing is denser so that it is more difficult for foreign bodies to penetrate. This increases puncture resistance.

In carcasses with 127 EPI, each individual thread is just 0.2 mm thick and, consequently, more vulnerable. This means that a 127 EPI tyre offers low puncture protection. 67 EPI offers the optimum compromise between weight and robustness.

Besides the webbing, the tyre's rubber compound is also important. The rubber compound comprises numerous parts:

40 60%	Natural and synthetic rubber	
15 30%	Fillers, e.g. carbon black, silicic acid or silica gel	
20 35%	 Anti-ageing agent Vulcanisation agent, e.g. sulphur Vulcanisation accelerator, e.g. zinc oxide Pigments and dyes 	

Table 17: Rubber compound in carcasses

Tread with profile

A rubber tread is attached to the exterior of the carcass.

The tread has little influence on riding characteristics on a smooth road. The grip between the road and tyre is mainly provided by the rolling friction between the rubber and the road surface.

Slicks and road tyres

Unlike cars, a pedelec will not aquaplane. The tread contact is small and the contact pressure high. Thanks to the small contact surface on narrow and treadless tyres, the tyre interlocks with the road surface finish. Theoretically, the tyre will not aquaplane until speeds of 200 km/h are reached.

On a clean road, whether dry or wet, slick tyres will grip more effectively than treaded tyres because the contact surface is larger. The rolling resistance of slick tyres is also lower.

Off-road tyres

The tread is highly important on terrain. In this case, the tread creates an interlock with the ground, thus enabling the driving, braking and steering forces to be transmitted. The MTB tread can also help improve control on dirty roads or farm tracks.

Tread blocks on MTB tyres deform as they meet the contact surface. The energy used for this is partly converted into heat. Another part is stored and converted into the tread block's sliding movement when it leaves the contact surface, which contributes to the tyre's wear.

If a tyre with a deep tread is used on asphalt, this may make an unpleasant noise. If a pedelec with an MTB tyre is mainly ridden on the road, it is thus best to change the tyre for a pair of tyres with as little tread as possible to reduce wear and save energy. In such a case, the specialist dealer needs to replace the tyre with a new one with a shallow tread.

Bead core

Tyre carcasses are wrapped around bead cores. Wrapping the carcass around both sides creates three carcass plies.

To ensure that tyres do not slip when inflated on the rim and have an effective grip, the bead cores are stabilised in two different ways:

Figure 22: Steel bead core (1) and Kevlar bead core (2)

- with a steel wire. These tyres are called clinchers.
- with aramid fibres (Kevlar®). These tyres are called folding tyres. Folding tyres are about 50-90 g lighter than clinchers. It can also be folded into a smaller pack size.

Puncture protection belt (optional)

There may be a puncture protection belt between the carcass and the tread.

Figure 23: Effect of puncture protection belt

Each tyre manufacturer has its own puncture protection classes which are not on par with one another.

3.3.3.3 Rim

The rim is the metal profile on a wheel which holds the tyre, tube and rim band together. The rim is joined to the hub with spokes.

In rim brakes, the outer surface of the rim is used to brake.

3.3.3.4 Valve

Each tube-type tyre has a valve. Air is pumped into the tyre via the valve. There is a valve cap on each valve.

The screw-on valve cap keeps out dust and dirt.

The pedelec has either a:

- Dunlop valve
- Presta valve
- Schrader valve

Dunlop valve

The Dunlop valve, also known as a conventional valve, is the most widely used valve. The valve insert can be replaced easily and air can be let out very quickly.

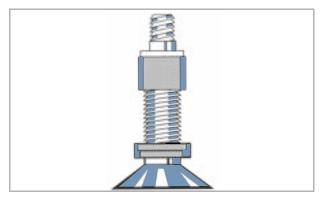

Figure 24: Dunlop valve

Presta valve

The Presta valve, also known as the Sclaverand valve or the French valve, is the narrowest variant of all valves. The Presta valve requires a smaller hole in the rim, which is why it is especially suitable for the narrow rims on racing bikes. It is about 4 to 5 g lighter than a Dunlop or Schrader valve.

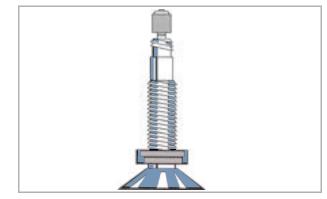

Figure 25: Presta valve

Schrader valve

The Schrader valve can be pumped at filling stations. Older, simple bicycle air pumps are unsuitable for Schrader valves.

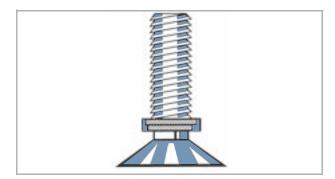

Figure 26: Schrader valve

3.3.3.5 Spoke

A spoke is a rod that connects the hub to the rim. The bent end of the spoke which is hooked into the hub is called the spoke head. A thread between 10 mm and 15 mm is attached to the other end of the spoke.

3.3.3.6 Spoke nipples

Spoke nipples are screw elements with an internal thread which fits onto the spoke thread. Fitted spokes are tensioned by tightening the spoke nipples. This straightens the wheel uniformly.

3.3.3.7 Hub

The hub is located in the centre of the wheel. The hub is connected to the rim and tyre with the spokes. An axle runs through the hub, connecting the hub with the fork at the front and with the frame at the rear.

The hub's main task is to transfer the pedelec's force of weight to the tyres. Special hubs on the rear wheel perform additional functions. There is a distinction between five types of hub:

- · Hubs without additional features
- Brake hub (see back-pedal brake)
- Gear hub, also known as a hub gear
- Generator hub (for bicycles only)
- Motor hubs (for front- and rear-driven pedelecs only).

Hub without additional features

The front wheel hubs on pedelecs with central or rear motors are normally hubs without additional features.

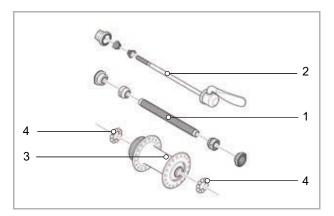

Figure 27: Example of front wheel hub: SHIMANO

- 1 Hub axle
- 2 Quick release
- 3 Hub body
- 4 Ball bearings

3.3.4 Saddle

The purpose of the saddle is to absorb body weight, provide support and enable different riding positions. The shape of the saddle thus depends on the intended use of the pedelec and the rider's physique and posture. When riding, the rider's body weight is distributed between the pedals, the saddle and the handlebars. When the rider is an upright position, the relatively small saddle area bears about 75% of their body weight.

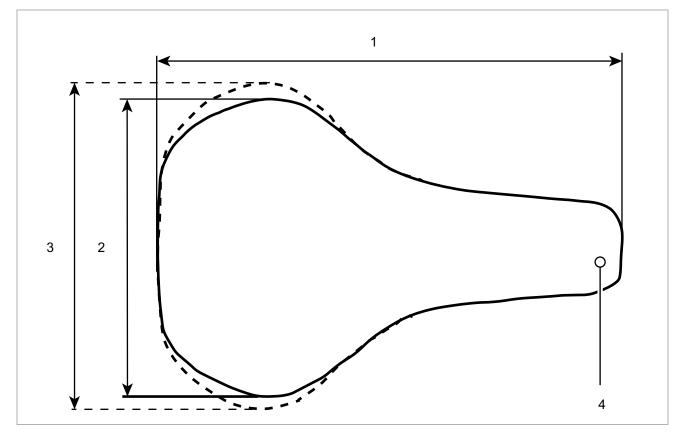

Figure 28: Saddle dimensions

- 1 Saddle length
- 2 Saddle width (narrow version)
- 3 Saddle width (wide version)
- 4 Saddle nose

The seat area is one of the most sensitive regions of the body. The saddle should allow the rider sit free of pain and fatigue. The saddle shape must suit each individual's anatomy. Solutions for sitting discomfort are listed in Section 9.1.

Saddles are provided in different sizes. The width of the pelvis and the gap between the sitting bones is crucial when selecting a saddle. Different saddle variants thus differ in their width.

You will find two methods to calculate the minimum saddle width in Sections 6.5.4.3 and 6.5.4.4.

3.3.4.1 Ladies' saddle

The distance between the ischial tuberosities and the pubic symphysis is on average a quarter less in women than in men. This is why painful pressure points can occur on men's saddles through the saddle nose since saddles that are too narrow or too soft press on the genitals or coccyx.

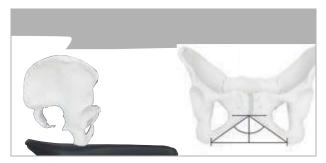

Figure 29: Female pelvis on saddles

For anatomical reasons, the pubic symphysis (front cartilage connection between the two halves of the pelvis) is, on average, a quarter lower than in the male pelvis. The angle between the pubic bones is wider.

The pelvis is more mobile in women than it is in men. Consequently, the pelvis often tilts forward more on the saddle. This causes high pressure in the genital area.

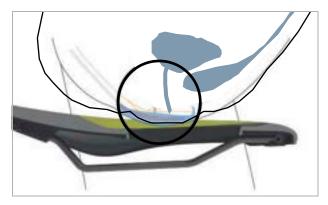

Figure 30: Pressure points on a saddle, female anatomy

3.3.4.2 Men's saddle

In contrast to the female anatomy, men's pubic bones are at a much steeper angle to one another. The pubic symphysis is much higher.

Figure 31: Male pelvis on saddles

The male pelvis is less flexible than women's. Men sit more upright on the saddle and put greater strain on the sitting bones. This means that the transition area between the saddle rear and nose can be kept narrow (Y-shape). This gives more space to pedal.

Numbness when pedalling is often caused by high pressure in the sensitive perineal area. If the saddle is adjusted incorrectly, too narrow or too hard, the nose of the saddle presses directly onto the genitals. Blood circulation deteriorates. The genitals on the outside are seldom the cause of discomfort since they can move out of the way and are not compressed by bone structures.

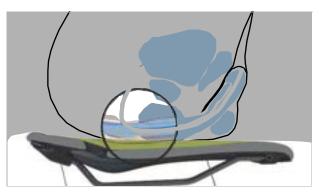

Figure 32: Pressure points on a saddle, male anatomy

3.3.5 Seat post

Seat posts are not designed to fasten the saddle but also to adjust exactly to the optimum sitting position. The seat post can:

- adjust the seat height in the seat tube
- adjust the saddle horizontally with a clamping mechanism and
- adjust the saddle angle by swivelling the entire saddle clamping mechanism.

Retractable seat posts feature a remote control on the handlebars, which can be used to lower the seat post at traffic lights, for example, and then raise it again.

3.3.5.1 Patent seat post

Figure 33: Example of ergotec patent seat post with either one or two seat clamp screws

Patent seat posts have a rigid link between the saddle and the post. Patent seat posts which are angled more markedly towards the rear are offset seat posts. Offset seat posts provide a greater distance between the saddle and the handlebars.

In patent saddle posts, the saddle is attached to the head with one or two seat clamp screws. It is recommended to lubricate the thread in these screws to ensure sufficient tension when tightening the screw.

Patent saddle posts are fastened into the seat tube with either a quick release or a screwable clamp.

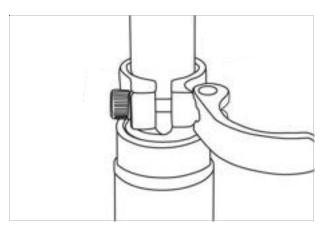

Figure 34: Example of a quick release

3.3.5.2 Suspension seat post

Suspension seat posts can reduce shock after one-time hard impacts, thus improving ride comfort significantly. However, suspension seat posts are not able to compensate for bumps in the road.

If the seat post is the only suspension element, the entire pedelec is a non-suspended mass. This has an unfavourable effect on loaded touring bikes or pedelecs with child trailers.

Suspension seat posts feature small, heavy-duty slide bearings, guides and articulated joints. If they are not lubricated on a regular basis, the sensitive response behaviour diminishes considerably, causing excessive wear.

The preload in non-damped suspension seat posts must be adjusted in such a way that the suspension seat post does not deflect with just body weight. This prevents the suspension seat post from deflecting and bobbing intermittently at higher pedalling frequencies or if the rider pedals irregularly.

The spring stiffness can be set lower with damped suspension seat posts, thus making use of the negative deflection.

3.3.6 Brake

A pedelec's brake system is primarily operated using the brake lever on the handlebars.

- If the left brake lever is pulled, the brake on the front wheel is applied.
- If the right brake lever is pulled, the brake on the rear wheel is applied.

The brakes are used to regulate speed and make an emergency stop. Applying the brakes will bring the pedelec to a safe, rapid halt in an emergency.

The brake is applied using the brake lever either

- with the brake lever and brake cable (mechanical brake) or
- with the brake lever and hydraulic brake cable (hydraulic brake).

3.3.6.1 Mechanical brake

The brake lever is connected to the brake via a wire inside the shift cable (also known as a Bowden cable).

Figure 35: Bowden cable structure

3.3.6.2 Hydraulic brake

The brake fluid is in a closed hose system. If the brake lever is pulled, the brake fluid transfers pressure to the brake on the wheel.

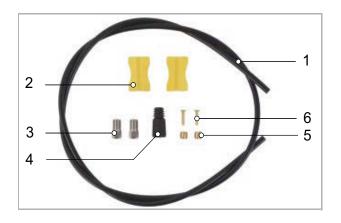

Figure 36: Components in a brake cable

- 1 Brake cable
- 2 Cable clip
- 3 Union nut
- 4 Cover cap
- 5 Knob
- 6 Insert pin

3.3.6.3 Disc brake

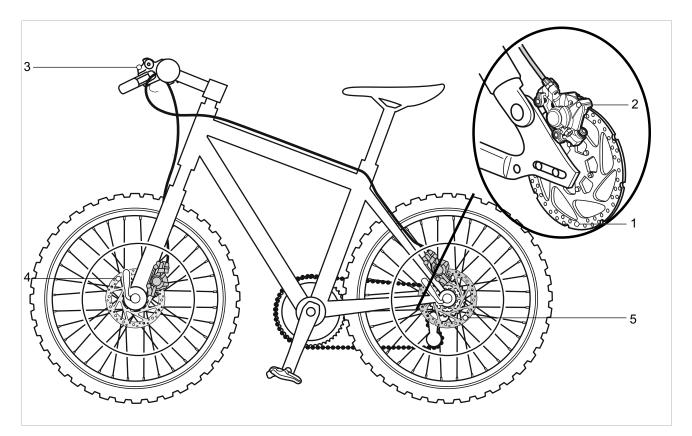

Figure 37: Brake system with disc brake – example

- 1 Brake disc
- 2 Brake calliper with brake linings
- 3 Handlebars with brake lever
- 4 Front wheel Brake disc
- 5 Rear wheel brake disc

On a pedelec with a disc brake, the brake disc is permanently screwed to the hub.

You increase brake pressure by pulling the brake lever. The brake fluid is used to transfer pressure through the brake cables to the cylinders in the brake calliper.

The braking force is boosted by a speed reduction and applied to the brake linings. These apply the brake disc mechanically. If the brake lever is pushed, the brake linings are pressed against the brake disc and the wheel movement is decelerated until it comes to a stop.

3.3.7 Mechanical drive system

The pedelec is driven by muscle power, just like a bicycle.

The force which is applied by pedalling in the direction of travel drives the front chain wheel. The chain or belt transmits the force onto the rear chain wheel and then onto the rear wheel.

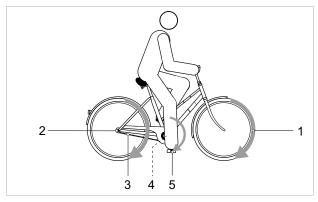

Figure 38: Diagram of mechanical drive system

- 1 Direction of travel
- 2 Chain or belt
- 3 Rear chainring or belt sprocket
- 4 Front chainring or belt sprocket
- 5 Pedal

The pedelec is equipped with either a chain or belt drive.

3.3.7.1 Chain drive layout

Figure 39: Chain drive with derailleur gears

- 1 Rear derailleur
- 2 Chain

The chain drive is compatible with a

- · Back-pedal brake,
- Hub gear or
- · Derailleur gears.

3.3.7.2 Belt drive layout

Figure 40: Belt drive

- 1 Front belt sprocket
- 2 Rear belt sprocket
- 3 Belt

A belt drive is compatible with

- · Back-pedal brake and
- Hub gear.

A belt drive is not compatible with derailleur gears.

3.3.8 Electric drive system

The pedelec has an electric drive system in addition to a mechanical one.

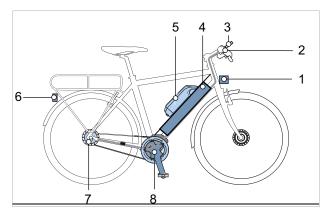

Figure 41: Diagram of an electric drive system with electric components

- 1 Front lamp
- 2 On-board computer
- 3 Display (optional)
- 4 PowerTube battery or
- 5 PowerPack battery
- 6 Rear light
- 7 Electric gear shift (optional)
- 8 Motor
- 9 A charger which is designed for the battery (not shown).

3.3.8.1 Motor

As soon as the muscle power required for pedalling passes a certain level, the motor is activated gently and assists the pedalling motion. The motor power always depends on the power used to pedal: Motor assistance is lower when little muscle power is used than when a great deal of muscle power is used. This happens regardless of the level of assistance.

The motor switches off automatically as soon as the rider no longer pedals, the temperature is outside the permitted range, there is an overload or the shut-off speed of 25 km/h has been reached.

A push assist system can be activated. The speed depends on the selected gear. The motor continues to drive the pedelec as long as the rider presses the push assist button on the handlebars. The speed can be a maximum of 6 km/h in this case. The electric drive system stops when the push assist button is released. The pedelec does not have a separate emergency shut-off button. In the event of an emergency, the motor can be stopped by removing the on-board computer. The mechanical brakes are used as an emergency stop system and bring the bicycle to a halt quickly and safely in the event of an emergency.

3.3.8.2 Charger

Each pedelec is supplied with a charger. The following BOSCH charger may be used:

• the 4 A Charger BPC3400.

Observe the operating instructions in the Section 11.4 Documents.

3.3.8.3 Lighting

Lighting always includes

- the front lamp (also known as headlight or front light)
- the rear light (also known as rear lamp)

The headlight and the rear light are also on whenever the riding light is activated.

3.3.8.4 Rechargeable battery

BOSCH batteries are lithium ion batteries which are developed and manufactured to the latest technical standards. Each battery cell is protected by a steel cup and encased in a plastic battery housing. Applicable safety regulations are met.

- The battery has an interior electronic protection circuit, which is specifically designed for the charger and the pedelec.
- The battery temperature is monitored at all times.
- The battery is protected against deep discharge, overcharging, overheating and short circuits by Electronic Cell Protection (ECP).

In the event of a hazard, a protective circuit switches the battery off automatically. In the event of a hazard, a protective circuit switches the battery off automatically.

The battery has a high energy content when charged. The code of practice for their safe handling is found in Section 2 Safety and Section 6.9 Rechargeable battery in the operating instructions. If the electric drive system is not used for 10 minutes and no button has been pressed on the on-board computer or the control panel, the electric drive system and the battery are automatically switched off to save energy.

The type and duration of operating conditions have a significant effect on the battery life. Just like any other lithium-ion battery, the battery will age naturally if it is not being used. The battery's service life can be extended if the battery is well maintained and stored at the correct temperature. The charging capacity will decrease with age, even if the battery is maintained properly. If the operating time is severely shortened after charging, this is a sign that battery has reached the end of its useful life.

Battery performance is reduced when the temperature drops since this increases electrical resistance. You should expect the range to be less than normal at low temperatures in winter. We recommend using thermal protection sleeves when riding longer distances at low temperatures.

Each battery has its own lock.

The following battery can be built into the pedelec:

PowerTube 500PowerTube 625PowerTube 750BBP375YBBP376YBBP377Y

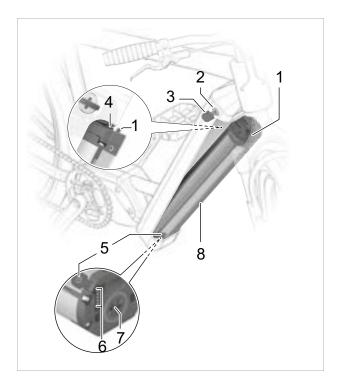

Figure 43: Details on PowerTube

- 1 Securing hook

	\sim			

Ambient light sensor 6 7 Increase brightness button/ forward button >

1. Selected level of assistance indicator

The higher the selected level of assistance, the more the drive system assists with pedalling.

eMTB mode is available for Performance Line CX drives. In eMTB mode, the assistance factor and the torque are dynamically adjusted depending on the pedalling force applied to the pedals.

Level of assistance	Colour	Use
OFF	Νο	When the drive system is switched on, the motor assistance is switched off. The pedelec can be used like a normal bicycle by simply pedalling.
ECO	Green	Limited assistance with maximum efficiency for maximum range
TOUR	Blue	Constant assistance, for long-range tours
e MTB/SPORT	Purple	Powerful assistance, for sporty start-up, optimal assistance on all types of terrain
TURBO	Red	Maximum assistance up to high pedalling frequencies, for sport riding

Table 18: Overview of level of assistance

2. ABS indicator (optional)

The ABS indicator lights up on pedelecs with an ABS system when they start up.

The ABS will switch off if the pedelec reaches a speed of 6 km/h.

If there is a fault, the ABS indicator lights up together with the indicator of the selected level of assistance, which will flash orange.

Press the Select button to acknowledge the fault and the flashing indicator for the selected level of assistance will go out. The ABS indicator remains lit to indicate that the ABS system is not in operation.

3. Battery level indicator (on-board computer)

The battery level indicator (on-board computer) shows the battery charge level. You can also see the battery charge level on the LEDs on the battery itself.

Each blue bar on the indicator signals 20% capacity and each white bar 10% capacity. The top bar indicates maximum capacity. The two lower indicators will change colour if the capacity is low:

Bars	Capacity
5 × blue	100 91%
4 × blue + 1× white	90 81%
4 × blue	80 71%
3 × blue + 1× white	70 61%
3 × blue	60 51%
2 × blue + 1× white	50 41%
2 × blue	40 31%
2 × orange	30 21%
1 × orange	20 11%
1 × red	10% reserve
1 x red, flashing	Reserve empty

The uppermost bar will flash if the battery is charging.

3.3.9.1 System message

The on-board computer indicates whether a critical or less critical error has arisen in the drive system.

The error messages generated by the drive system can be read in the eBike Flow app and by the specialist dealer.

The rider can use a link in the eBike Flow app to display all information on errors and assistance on eliminating errors.

You will find more information and a table containing all system messages in Section 6.2.

3.3.9.2 Creating a user account

The rider needs to register on a PC or their smartphone and create a user account to use all the drive system's functions.

The user account can be used to change settings, analyse routes and ride data and activate premium functions among other things.

3.3.9.3 Software updates

Software updates are automatically transferred to the on-board computer in the background of the Bosch eBike Flow smartphone app as soon as the app is connected to the on-board computer.

Once an update has been completely transferred, this is displayed three times when the on-board computer is restarted.

Alternatively, the user can check whether an update is pending under Settings **<My eBike>** <Components>.

3.3.9.4 Activity tracking

User recognition is required on a PC or smartphone to record activities.

The rider needs to agree to location data being saved on the portal or the app to record activities. Only then will all activities be displayed on the portal or app.

Your location will only be logged if the on-board computer is connected to the eBike Connect app.

Activities will be displayed after synchronisation in the app and on the portal.

3.3.9.5 Lock function

When the lock function is used, the on-board computer acts in a similar way to a key for the drive system. Once the lock function is switched on, the e-bike drive unit assistance is deactivated by removing the on-board computer. The rider can continue to use the mechanical drive system.

It can then only be activated using the on-board computer belonging to the pedelec. The lock function is linked to the eBike Connect app user account.

The lock function does not provide anti-theft protection; it is more a supplement to a mechanical lock. The lock function does not provide mechanical blocking of the pedelec or similar. It only deactivates assistance from the drive unit.

If third parties are to have temporary or permanent access to the pedelec, the lock function must be deactivated in the eBike Connect app.

When activating and deactivating the lock function, the drive system emits audible lock signals. The audible feedback signal is activated by default. The feedback signal can be deactivated under Settings **<My eBike>**.

3.3.10 Handbrake

There is a handbrake on the left and right of the handlebars.

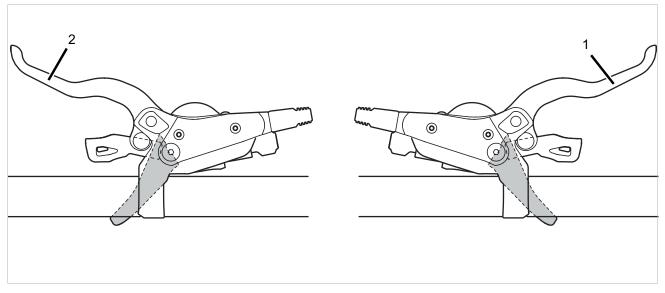

Figure 45: Front wheel (2) and rear (1) brake levers – Shimano brake used as an example

The left handbrake (2) controls the front wheel brake.

The right handbrake (1) controls the rear wheel brake.

3.3.11 Suspension and damping

3.3.11.1 Air valve and sag setting wheel

SR SUNTOUR

Table 19: SR Suntour sag setting wheel depending on suspension fork

3.3.12 Gear shift

3.3.12.1 SHIMANO derailleur gears

Only applies to vehicles with this equipment

The gear shift is on the right of the handlebars. The gear shift has one or two shifters.

SHIMANO SL-M315 gear shift

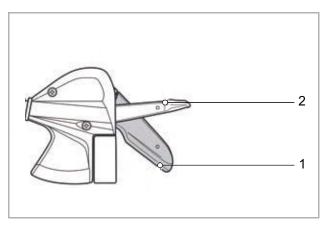

Figure 46: Example of SHIMANO SL-M315

- 1 Shifter A
- 2 Shifter B

SHIMANO SL-M3100 gear shift

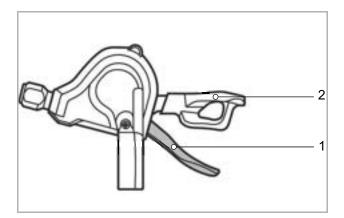

Figure 47: Example of SHIMANO SL-M3100

- 1 Shifter A
- 2 Shifter B (optional)

3.3.13 Battery level indicator (battery)

Each battery has its own level indicator:

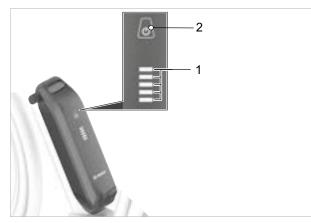

Figure 48: BOSCH PowerPack battery indicator and operating element

Figure 49: BOSCH PowerTube battery indicator and operating element

- 1 On-Off button (battery)
- 2 Battery level indicator (battery)

3.3.13.1 Battery level indicator (battery)

The five green LEDs on the battery level indicator show the charge level when the battery is switched on. Each LED represents 20% of battery capacity.

LED 1,2,3,4,5	Battery level
$\bullet \bullet \bullet \bullet \bullet \bullet$	100 80%
$\bullet \bullet \bullet \bullet \circ \circ$	79 60%
•••00	59 40%
••000	39 20%
•0000	19 15%
00000	5 0%

Figure 50: Battery level indicator

Symbols:

All five LEDs will light up when the battery is fully charged. The charge level for the activated battery is also shown on the on-board computer.

If the battery capacity is less than 10%, the last remaining LED indicator will flash.

If the battery level falls below 5%, all the LEDs on the operating status and battery level indicator will go out.

The battery level is still shown on the on-board computer.

3.4 Technical data

3.4.1 Pedelec

Power output/system	250 W (0.25 kW)
Shut-off speed	25 km/h
Charging temperature	0 °C +40 °C
Operating temperature	-5 °C +40 °C
Storage temperature	+10 °C +40 °C

Table 20: Pedelec technical data

3.4.2 Emissions

The safety requirements as per Electromagnetic Compatibility Directive 2014/30/EU have been met. The pedelec and the charger can be used in residential areas without restriction.

A-weighted emission sound pressure level	< 70 dB(A)
Total vibration level for the hands and arms	< 2.5 m/s²
Highest effective value of weighted acceleration for the entire body	< 0.5 m/s²

Table 21: Emissions from the pedelec

3.4.3 Bicycle lighting

Voltage about	12 V
Maximum output	
Front light	17.4 W
Rear light	0.6 W

Table 22: Bicycle lighting

3.4.4 LED Remote on-board computer

Internal lithium ion battery	3.7 V, 75 mAh	
Charging temperature	0 °C +45 °C	
Operating temperature	-5 °C +40 °C

3.4.4.1 BOSCH Performance Line CX motor

Maximum continuous power rating	250 W
Max. torque	85 Nm
Max. support	340%
Crank-chainring transmission	1: 1
Max. speed	25 km/h
Nominal voltage	36 V DC
Permitted chainline	47.5 mm 0/+15 mm
Crank interface	ISIS
Crank screws	M15 × 1
IP protection class	IP54
Weight about	3 kg
Operating temperature	-5 +40 °C
Mass	approx. 2.9 kg
Storage temperature	-10 +40 °C

Table 24: Technical data for BOSCH Performance Line CXmotor, BDU3740, BDU3741

3.4.5 Rechargeable battery

3.4.5.1 BOSCH PowerTube 500 battery

Nominal voltage	36 V
Nominal capacity	13.4 Ah
Energy	500 Wh
Weight	3.0 kg
Protection class	IP54
Operating temperature	-5 +40 °C
Storage temperature	+10 +40 °C
Permitted charging temperature range	0 40 °C

Table 25: Technical data for BOSCH PowerTube 500, BBP3750 horizontal, BBP3751 vertical

3.4.5.2 BOSCH PowerTube 625 battery

Nominal voltage	36 V
Nominal capacity	16.7 Ah
Energy	625 Wh
Weight	3.6 kg
Protection class	IP54
Operating temperature	-5 +40 °C
Storage temperature	+10 +40 °C
Permitted charging temperature range	0 40 °C

Table 26: Technical data for BOSCH PowerTube 625, BBP3760 horizontal, BBP3761 vertical

3.4.5.3 BOSCH PowerTube 750 battery

Nominal voltage	36 V
Nominal capacity	20.1 Ah
Energy	750 Wh
Weight	4.3 kg
Protection class	IP54
Operating temperature	-5 +40 °C
Storage temperature	+10 +40 °C
Permitted charging temperature range	0 40 °C

Table 27: Technical data for BOSCH PowerTube 750, BBP3770 horizontal, BBP3771 vertical

3.4.6 Fork

3.4.6.1 Maximum rider weight for SR SUNTOUR steel suspension fork

SR SUNTOUR steel suspension forks are available in three different hardness types for different body weights:

Coil spring model	Soft	Medium Fitted as standard	Hard/rigid
Max. bodyweight [kg]	50 - 75	70-95	90-120

3.4.7 Saddle

3.4.7.1 BROOKS ENGLAND saddle width

Riding position	
Narrow saddle	Position on trekking bike
Sharply inclined upper body, back at an angle of 30°…60°.	
Medium-width saddle	Position on city bike
Slightly inclined upper body, back at an angle of 60°70°.	
Wide saddle	Position on roadster
Upright, almost vertical posture, back at an angle of almost 90°.	

Table 28: BROOKS ENGLAND Specifications

3.4.7.2 ERGON

Suitable sit bone distance	
Medium/large	12 - 16 cm
Small/medium	9 - 12 cm

Table 29: ERGON Specifications

3.4.7.3 SELLE ROYAL saddle width

Riding position	
Athletic	Position on trekking bike
Sharply inclined upper body, back at an angle of 30°60°.	
Moderate	Position on city bike
Slightly inclined upper body, back at an angle of 60°70°.	
Relaxed	Position on roadster
Upright, almost vertical posture, back at an angle of almost 90°.	
Suitable sit bone distance	
Small	<11 cm
Medium	11 - 13 cm
Large	>13 cm

3.4.7.4 Tyres, SUPERO puncture protection level

R L 7	Level 7 An EPS webbing layer is located beneath a 3-mm LPD layer.
	Level 6
TE E	An EPS webbing layer is combined with a 1-mm layer of rubber.
0	EPS BtB
() L5	EPS BtB (wire-to-wire). The side walls are also protected with a poly- fibre webbing layer in addition to the tread.
-	EPS 2
	A tyre with a 5 EPS protection level has a poly-fibre webbing layer. The webbing is located between the tread and the carcass.
	LDP
R L 5	A tyre with a 5 LDP protection level has an LDP puncture protection webbing layer 3 mm thick. This is an extra thick rubber layer between the tread and the carcass.
0	EPS 1
E	Tyres with Level 4 protection feature an additional dense EPS webbing layer. As a result, the tyre is light and is suitable for racing and ATB bikes.
	Kevlar® Inside
	Tyres with Kevlar® Inside feature a Kevlar® webbing layer 1.5 mm thick between the carcass and wheel.
	The carcass has 60 EPI from Protection Level 2.
	APL puncture protection
	APL puncture protection offers a rubber protection layer 1 mm thick between the carcass and the tread. The carcass has between 22 and 32 EPI.

4 Transporting and storing

4.1 Weight and dimensions for transportation

Weight and dimensions during transport # Not yet available when the instructions were produced

4.2 Designated handles, lifting points

The box does not have any handles.

4.3 Transportation

Crash caused by unintentional activation

There is a risk of injury if the drive system is activated unintentionally.

Remove the battery.

4.3.1 Using the transport securing system

Applicable for pedelec disc brakes only

Oil leak if no transport securing device

The brake securing device prevents the brakes from being applied accidentally during transportation or shipment. This could cause irreparable damage to the brake system or an oil leak, which will harm the environment.

- Never push the brake lever when the wheel has been dismounted.
- Always use the transport securing system when transporting or shipping.
- Insert the transport securing devices between the brake linings.
- ⇒ Transport securing device is squeezed between the two linings and prevents undesired sustained braking which can cause brake fluid to leak out.

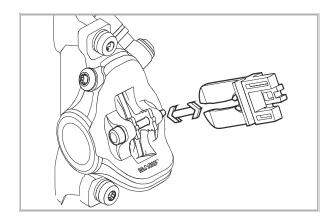

Figure 51: Fastening the transport securing device

4.3.2 Transporting the pedelec

4.3.2.1 By car

Bicycle rack systems which use the handlebars or frame to hold the pedelec in an upside-down position exert inadmissible forces on its components during transportation. This can cause the supporting parts to break.

- Remove battery and all detachable components (screen, bicycle pump, water bottle and similar) from the pedelec.
- Transport the battery in a dry, clean position where it is protected from direct sunlight.
- Never use bicycle rack systems which use the pedelec's handlebars or frame to hold the pedelec in an upside-down position. The specialist dealer will give a consultation on correct selection and safe use of a rack system.
- Take into account the weight of the ready-touse pedelec when transporting it.

4.3.2.2 By train

Pedelecs can usually be transported in trains with a bicycle compartment.

- ✓ If you want to take your e-bike with you on the train, you should take into account that routes to platforms are not always barrier-free. You should thus allow enough time to get on and off the train.
- **1** Buy a bicycle ticket for the pedelec.
- 2 Fasten the pedelec securely in the compartment.
- **3** Take a seat in the passenger carriage.

It is possible to take a pedelec on certain highspeed train routes. The battery must remain firmly mounted during the journey and must not be charged.

4.3.2.3 By local transport

You can normally take pedelecs on local public transport, e.g. by bus or suburban rail, if you purchase a bike ticket. There may be times when this is not permitted. Local transport companies will give you relevant information.

4.3.2.4 By long-distance bus

Pedelecs can usually be taken on the longdistance bus for an extra charge, although places are limited. It is best to book early. However, not every bus line accepts pedelecs. You should check with the long-distance bus provider concerned before travelling.

4.3.2.5 On flights

It is forbidden to transport rechargeable batteries on passenger planes. Most airlines won't even transport pedelecs without batteries on passenger planes either.

It is a good idea to find out about pedelec leasing at your destination in advance if you wish to use a pedelec while on holiday. This way, you won't need to forgo pedelec riding fun during your holidays.

4.3.3 Shipping a pedelec

When shipping the pedelec, we recommend that you have the specialist dealer place it in proper packaging.

4.3.4 Transporting the battery

Batteries are subject to hazardous goods regulations. Undamaged batteries may be transported by private persons in road traffic.

Commercial transport operators must comply with regulations on packaging, labelling and the transportation of hazardous goods. Open contacts must be covered and the battery securely packaged.

4.3.5 Shipping the battery

The battery is considered a hazardous good and only trained persons may pack and ship a battery. Contact specialist dealer.

If you have a valid hazardous good certificate, pack and ship the battery as per current hazardous goods regulations.

4.4 Storing

Always store pedelec, battery, on-board computer, display and charger separately.

computer, display and charger separately.		
Storage temperature +10 +40 °C		
Humidity	30%85%	
Ideal storage temperature	+10 +20 °C	
Optimum air humidity	30%60%	

Table 32: Ambient conditions for storage

- Temperatures under -5 °C or over +40 °C and air humidity over 85% must generally be avoided.
- Store pedelec, on-board computer, battery and charger in a place which is
- dry
- clean
- · protected from direct sunlight
- well-ventilated
- Never store in the open air.

4.4.1 Pedelec

Store pedelec in a garage or a dry basement.

4.4.2 On-board computer, display and charger

Store on-board computer, display and charger in a dry environment at room temperature.

4.4.3 Rechargeable battery

- Storage at about 10 °C to 20 °C is beneficial to a long battery life.
- Store batteries in rooms with smoke detectors. A protection box with an electrical connection is an optimal solution.
- Never store batteries near to inflammable or easily combustible objects.
- ▶ Never store batteries near sources of heat.

New battery

- ✓ Inspect battery for damage after delivery.
- ➡ If the batteries are damaged, observe Section 2.1 Handling a damaged or faulty battery during storage and disposal.
- ✓ It is best to store damage-free batteries separately for 24 hours and keep them under observation.

If no faults occur, store batteries in a separate room with fire doors and smoke detectors. If the battery is stored in its original packaging, stack a maximum of five batteries on top of one another.

Battery in use

1 Immediately remove batteries from customer pedelec before maintenance or repair.

Treat unchecked batteries as faulty batteries.

When storing batteries, treat them in the same way as a damaged or faulty battery until they are inspected.

- **2** Inspect battery.
- **3** Battery are stored as agreed with the insurance company.

Faulty battery

4 If batteries are faulty, observe Section 2.1 Handling a damaged or faulty battery during storage and disposal.

4.4.4 Break in operation

Notice

The battery discharges when not in use. This can cause irreparable damage to the battery.

The battery must be recharged every 6 months.

The battery may become damaged if it is connected permanently to the charger.

Never connect the battery to the charger permanently.

If the battery is stored for a longer period of time when empty, it can become damaged despite low self-discharge and the storage capacity can be greatly reduced

- Store battery with at least 30% charge.
- Charge components every 3 months for around 1 hour via the USB diagnostic interface to avoid an extremely low charge level in the integrated battery in the LED remote and the system controller.
- Remove the on-board computer and battery from their mount if the pedelec is not going to be used for up to four weeks.
- If the pedelec is removed from service for longer than four weeks, you need to prepare it for a break in operation.

- 4.4.4.1 Preparing a break in operation
- Remove the rechargeable battery from the pedelec.
- ✓ Charge battery between 30% and 60% so that 2 to 3 LEDs light up on the battery level indicator.
- ✓ The pedelec needs to be cleaned with a damp cloth and preserved with wax spray. Never wax the friction surfaces of the brake.
- ✓ Before longer periods without use, it is recommended to have the specialist dealer carry out maintenance and basic cleaning and apply preservative agent.
- 4.4.4.2 Carrying out a break in operation
- Store the pedelec, battery and charger in a dry, clean environment. We recommend storing them in uninhabited rooms with smoke alarms. Dry locations with an ambient temperature between 10 °C and 20 °C are ideal.
- 2 Check the battery level after 6 months. If only one LED on the battery level indicator lights up, recharge the battery to between 30% and 60%.

5 Assembly

Risk of eye injury

Problems may arise if components are set incorrectly. They may cause serious injuries to the face.

 Always wear safety glasses to protect eyes when assembling pedelecs.

Crash and crushing hazard caused by unintentional activation

There is a risk of injury if the electric drive system is activated unintentionally.

- Remove the battery.
- Assemble the pedelec in a clean, dry environment.
- ✓ The work environment temperature should be between 15 °C and 25 °C.
- ✓ The fitting stand used must be approved for a maximum weight of least 30 kg.

5.1 Unpacking

The packaging material consists mainly of cardboard and plastic film.

- Dispose of the packaging in accordance with the regulatory requirements (see Section 10).
- ➡ Pedelecs are fully assembled in the factory for test purposes and then dismantled for transportation. The pedelec is 95% to 98% preassembled.

Scope of delivery

1 × pre-assembled pedelec
1 × front wheel
2 × pedals
2 × quick releases (optional)
1 × charger
1 × set of operating instructions on CD
1 × battery (supplied separately from the pedelec)

5.2 Required tools

The following tools are required to assemble the pedelec:

	Knife
Z	Ring spanners 8 mm, 9 mm, 10 mm, 13 mm, 14 mm and 15 mm
e ka	Torque wrench Working range 5… 40 Nm
۲	by.schulz handlebars: TORX® bits: T50, T55, and T60
0	Hex key 2 mm, 2.5 mm, 3 mm, 4 mm, 5 mm, 6 mm and 8 mm
0	Cross-recess screwdriver
•	Slotted-head screwdriver

Table 33: Tools required for assembly

5.3 Commissioning

Only trained specialist staff may perform initial commissioning since initial commissioning of the pedelec requires special tools and specialist knowledge.

Experience has shown that a pedelec which has not yet been sold is automatically handed to customers as soon as it appears ready to ride.

- It makes sense to prepare each pedelec so that it is fully ready for use immediately after being assembled.
- The assembly report (see Section 11.2) describes all safety-relevant inspections, tests and maintenance tasks.
- All assembly work must be completed to ensure the pedelec is ready to ride.
- Complete an assembly report to document quality assurance (see Section 11.1).

5.3.1 Checking the battery

The battery must be checked before it is charged for the first time.

- Press the **On-Off button (battery)**.
- ⇒ If none of the LEDs on the **battery level** indicator light up, the battery may be damaged.
- ⇒ The battery may be fully charged if at least one, but not all, of the LEDs on the **battery level indicator** lights up.

5.3.2 Adjusting the suspension system to body weight

Not included in price

Seat post and forks are components that may be replaced after approval by the vehicle or parts manufacturer.

Replacing with different sizes and hardnesses within a product series is permitted for seat posts.

Steel suspension in suspension forks and seat posts are designed to bear body weight. If the body weight is exceeded or not reached, the suspension system will no longer function as intended. This has no effect on the fork's or seat post's approved load capacity but the suspension system will no longer function perfectly or it won't work at all.

Adjust all components such as suspension forks or suspension seat posts with steel springs to the rider's body weight. 5.3.2.1 Adjusting SR Suntour suspension elements

Not included in price

SR SUNTOUR steel suspension forks and parallelogram seat posts are available in three different hardness types for different body weights:

Coil spring model	Soft	Medium	Rigid
Max. bodyweight [kg]	50 75	70 95	90 120

Table 34: Suspension hardness and body weight

Unless specified otherwise, SR Suntour forks and seat posts are supplied with medium hardness ex factory.

A harder and a softer suspension hardness are available so that the suspension fork can be adjusted to the rider's body weight.

Figure 52: SR Suntour coil spring hard

- 1 Ask about body weight before selling the pedelec.
- 2 Compare with Table <u>34</u>.
- 3 If the body weight differs from the specifications, order suitable spring elements from SR Suntour and install them.

5.3.3 Installing the wheel in the SUNTOUR fork

Only applies to Suntour forks with this equipment

5.3.3.1 Screw-on axle (12AH2 and 15AH2)

Only applies to Suntour forks with this equipment

- Before installing the wheel, ensure that the O-ring is in the right position on the thread piece.
- 1 Insert the front wheel into the fork ends.
- 2 Insert the axle into the hub on the drive side.

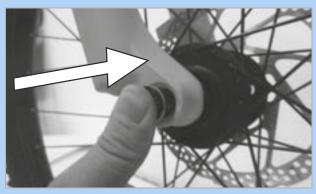

Figure 53: Inserting the axle in the direction of the arrow

3 Use a 6 mm hex key to tighten the axle using between 8 and 10 Nm. The axle thread must be visible.

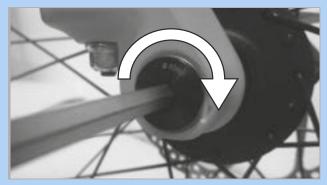

Figure 54: Tighten the axle in the direction of the arrow

4 Insert the securing screw on the non-drive side.

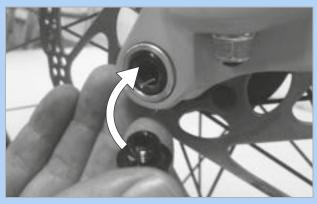

Figure 55: Inserting the securing screw

5 Tighten the securing screw with a 5 mm hex key using between 5 and 6 Nm.

Figure 56: Tightening the securing screw

⇒ The wheel is now fitted.

5.3.3.2 20 mm cross axle

Only applies to Suntour forks with this equipment

Crash caused by loose cross axle

A faulty or incorrectly installed cross axle may become caught in the brake disc and block the wheel. This will cause a crash.

Never fit a defective cross axle.

Crash caused by faulty or incorrectly installed cross axle

The brake disc becomes very hot during operation. Parts of the cross axle may become damaged as a result. The cross axle becomes loose. This will cause a crash with injuries.

The cross axle and the brake disc must be opposite one another.

Crash caused by incorrectly set cross axle

Insufficient clamping force will result in unfavourable transmission of force. The suspension fork or the quick release axle may break. This will cause a crash with injuries.

- Never fasten the cross axle with a tool (e.g. hammer or pliers).
- 1 Insert the cross axle into the hub on the drive side.

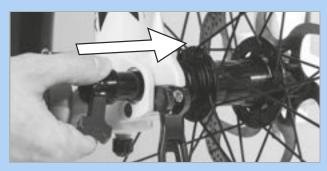

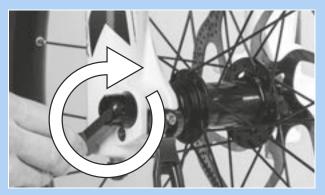

Figure 57: Inserting the cross axle in the direction of the arrow

2 Tighten the cross axle with the red handle.

- Figure 58: Tighten the axle in the direction of the arrow
- 3 Push red lever into the cross axle.

Figure 59: Pushing the red lever in the direction of the arrow

4 Closing the quick release lever.

Figure 60: Pressing the quick release lever in the direction of the arrow

⇒ The cross axle is secured.

5 Check the position and clamping force of the quick release lever. The quick release lever must be flush with the shock absorber.

Figure 61: Perfect position for the clamping lever

6 Use 4 mm hexagon socket spanner to adjust the clamping lever clamping force if required.

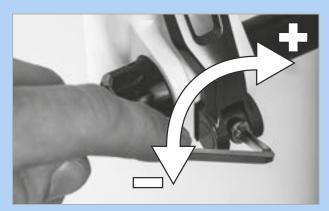

Figure 62: Adjusting the quick release clamping force

- 7 Check the quick release lever position and clamping force.
- \Rightarrow The wheel is now fitted.

5.3.3.3 Q-LOC quick release

Only applies to Suntour forks with this equipment

Crash caused by unfastened quick release

A faulty or incorrectly installed quick release may become caught in the brake disc and block the wheel. This will cause a crash.

Never fit a defective quick release.

Crash caused by faulty or incorrectly installed quick release

The brake disc becomes very hot during operation. Parts of the quick release may become damaged as a result. The quick release comes loose. This will cause a crash with injuries.

The front wheel quick release lever and the brake disc must be situated on opposite sides.

Crash caused by incorrectly set clamping force

Excessively high clamping force will damage the quick release and cause it to lose its function. Insufficient clamping force will result in unfavourable transmission of force. The suspension fork or the quick release may break. This will cause a crash with injuries.

- Never fasten a quick release using a tool (e.g. hammer or pliers).
- Only use the clamping lever with the specified set clamping force.
- ✓ Before installing, ensure that the quick release flange is extended. Open the lever fully.

Figure 63: Closed and opened flange

1 Push in the quick release until you can hear a click. Make sure that the flange is extended.

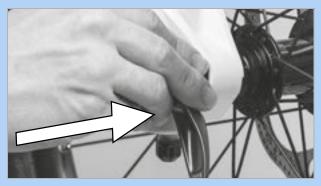

Figure 64: Inserting the quick release in the direction of the arrow

2 Adjust tensioning with half-open clamping lever until the flange reaches the fork end.

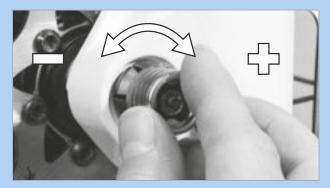

Figure 65: Adjusting the clamping

3 Fully close the quick release. Check that it is firmly in place and adjust it on the flange if necessary.

Figure 66: Closing the quick release

⇒ The wheel is now fitted.

5.3.4 Preparing the wheel

There is an arrow on the sides of the tyres with the inscription ROTATION to show the direction of rotation. The inscription says DRIVE on older tyres. The rotation direction arrow indicates the recommended direction of rotation. On road tyres, the direction of rotation is mainly for optical reasons.

Figure 67: Rotation direction arrow

The direction of rotation is much more important on off-road terrain because the tread creates an interlock with the ground. While the rear wheel needs to transmit the drive forces, the front wheel is responsible for transmitting braking and steering forces. Drive and braking forces have different directions of action. This is why some tyres are mounted on the front and rear wheels in opposite directions. On these tyres, there are two rotation direction arrows:

- The FRONT rotation direction arrow indicates the recommended direction of rotation for the front wheel.
- The REAR rotation direction arrow indicates the recommended direction of rotation for the rear wheel.

Figure 68: Rotation direction arrow on MTB tyres

- The rotation direction arrow must point in the direction of travel when the wheel is placed in the fork.
- There are also non-directional tyre profiles with no rotation direction arrow.

5.3.5 Fitting the pedals

The pedals have two different threads to ensure they don't come loose while the rider is pedalling.

- The pedal on the left facing the direction of travel has a left-hand thread and is marked L.
- The pedal on the right facing the direction of travel has a right-hand thread and is marked R.

The mark is either on the top end, the axle or the pedal body.

Figure 69: Example of mark on pedals

- 1 Coat threads in both pedals with waterproof grease.
- 2 Turn the pedal marked L anti-clockwise by hand into the crank arm on the left as seen when facing the direction of travel.

Figure 70: L-pedal in the left-hand crank arm

3 Turn the pedal marked R anti-clockwise by hand into the crank arm on the right as seen when facing the direction of travel.

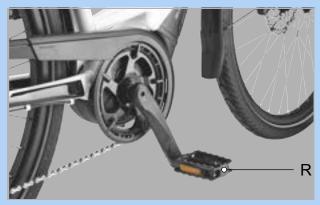

Figure 71: R-pedal in the right-hand crank arm

4 Use a 15 mm spanner to fasten the left-hand pedal thread in an anti-clockwise direction and the right-hand pedal in a clockwise direction with a torque between 33 Nm and 35 Nm.

5.3.6 Checking the stem and handlebars

5.3.6.1 Checking the connections

- 1 Stand in front of the pedelec. Clamp the front wheel between your legs. Grasp the handlebar grips.
- 2 Try to twist the handlebars against the direction of the front wheel.
- ⇒ The stem must not move or twist.
- 3 If the stem can be twisted, check fastening.
- ➡ If the stem cannot be fastened, contact your specialist dealer.

5.3.6.2 Checking stem is firmly in position

- 1 Press full body weight on the handlebars.
- ➡ The handlebars must not move downwards in the fork.

Stem with clamping lever version I

- 2 If the handlebars should move, increase the lever tension in the clamping lever.
- **3** Turn knurled nut in a clockwise direction with the clamping lever open.
- 4 Close clamping lever and check stem is firmly in position again.
- 5 If the handlebars cannot be fastened, contact your specialist dealer.

Stem with clamping lever version II and stem with screw

If the handlebars cannot be fastened, contact your specialist dealer.

5.3.6.3 Checking the bearing clearance

- Place the fingers of one hand on the upper headset cup. Pull the front wheel brake with the other hand and try to push the pedelec backwards and forwards.
 Keep in mind that there may be noticeable backlash due to worn-out bearing bushes or brake lining backlash in suspension forks and disc brakes.
- ➡ The headset cup halves must not move towards one another.
- 2 Adjust bearing clearance as per the stem repair manual as quickly as possible; otherwise, the bearing will become damaged. Contact specialist dealer.

5.4 Selling the pedelec

- Complete pedelec pass on the operating instructions envelope.
- Note down the manufacturer and the number of the battery key.
- Adjust the pedelec; see Section 6.5.
- Adjust the stand and shifter.
- Brief pedelec rider on all the pedelec's functions (see Section 6.3).

6 Operation

/!_WARNING

Injuries and death caused by blind spots

Other road users, trucks, cars and pedestrians often underestimate the speed of pedelecs. Likewise, other road users frequently do not see pedelecs. This may lead to an accident with serious injuries or even death.

- Wear a helmet. The helmet must have a reflective strip or a light in a clearly visible colour.
- Clothing should be retroreflective or as light as possible. Fluorescent materials are also suitable. High-visibility jackets and straps on your upper body ensure even greater safety.
- Always take a defensive approach to riding.
- Avoid the blind spots of vehicles turning off the road. Reduce speed as a precaution when other road users turn right.

Injuries and death caused by riding incorrectly

A pedelec is not a bicycle. Mistakes made while riding and underestimated speeds quickly lead to hazardous situations. This can cause an accident with serious or fatal injuries.

- Slowly get used to road traffic and speed before riding at speeds over 12 km/h, especially if you have not ridden a bike for some time.
- ▶ Increase the levels of assistance gradually.
- Practice braking hard on a regular basis.
- Take and complete a riding safety course.

WARNING

Injuries and death caused by distraction

A lack of concentration while riding increases the risk of an accident. This may cause a crash with serious injuries.

- Never allow yourself to be distracted by the on-board computer or your mobile phone.
- Stop the pedelec if you want to make inputs on the on-board computer other than change the level of assistance. Only enter data when stationary.

Crash caused by loose clothing

Laces, scarves and other loose items may become entangled in the spokes on the wheels and the chain drive. This may cause a crash with injuries.

 Wear sturdy footwear and close-fitting clothing.

Crash caused by difficult-to-spot damage

If the pedelec topples over or you have a fall or an accident, there may be difficult-to-spot damage to components such as the brake system, quick releases or frame. This may cause a crash with injuries.

 Take pedelec out of service. Contact specialist dealer.

Crash caused by soiling

Heavy soiling can impair pedelec functions, such as braking. This may cause a crash with injuries.

Remove coarse soiling before riding.

Crash caused by material fatigue

Intensive use can cause material fatigue. A component may suddenly fail in case of material fatigue. This may cause a crash with injuries.

- Remove the pedelec from service immediately if there are any signs of material fatigue. Have your specialist dealer inspect the component.
- Arrange the mandatory inspection appointments with your specialist dealer on a regular basis. During the major inspection, the specialist dealer will inspect the pedelec for any signs of material fatigue on the frame, fork, suspension element mountings (if there are any) and components made of composite materials.

Carbon becomes brittle when exposed to heat radiation such as heating. This can cause the carbon part to break and result in a crash with injuries.

Never expose carbon components parts on the pedelec to strong sources of heat.

Crash caused by poor road conditions

Loose objects, such as branches and twigs, may become caught in the wheels and cause a crash with injuries.

- Be aware of the road conditions.
- ▶ Ride slowly and brake in good time.

The *tyres* may slip on wet roads. In wet conditions you must also expect a longer braking distance. The braking sensation differs from the usual sensation. This can cause loss of control or a crash, which may result in injuries.

Ride slowly and brake in good time when it is raining.

Notice

Heat or direct sunlight can cause the *tyre pressure* to increase above the permitted maximum pressure. This can destroy the *tyres*.

- Park pedelec in the shade.
- On hot days, regularly check the tyre pressure and adjust it as necessary.

When riding downhill, high speeds may be reached. The pedelec is only designed to exceed a speed of 25 km/h for short intervals. The *tyres* in particular can fail if exposed to a continuous load.

Use the brakes to decelerate the pedelec if you reach speeds greater than 25 km/h.

Moisture penetrating at low temperatures may impair individual functions due to the open structural design.

- Always keep the pedelec dry and free from frost.
- If the pedelec is used at temperatures below 3 °C, the specialist dealer must perform a major inspection beforehand and prepare it for winter use.

Off-road riding subjects the joints in the arms to severe strain.

Take a break from riding every 30 to 90 minutes, depending on the road surface conditions and your physical fitness.

6.2 Tips for a greater range

The pedelec's range depends on many influencing factors. A single battery charge may only last fewer than 20 kilometres but much more than 100 is also possible. Test the pedelec's range before embarking on longer rides. There are a few tips which will generally help you maximize range.

Suspension elements

Only open suspension fork and damper when necessary on terrain or gravel paths. Block suspension fork and damper on tarmacked roads or on hills.

Mileage

The more own physical effort the rider makes, the greater the attainable range is.

Shift down 1 to 2 gears to increase the induced power and pedalling frequency.

Pedalling frequency

- Ride using pedalling frequencies of over 50 revolutions per minute. This optimises the electric drive's efficiency.
- Avoid pedalling very slowly.

Weight

Minimise the total weight of pedelec and baggage.

Stopping and starting

- ▶ Ride long distances at a constant speed.
- ► Avoid stopping and starting frequently.

Level of assistance

The lower the selected levels of assistance are, the greater the range is.

Gear switching habits

- ► Use a low gear and a low level of assistance on hills and when setting off.
- Switch up a gear depending on the speed and terrain.
- ▶ 50-80 crank rotations per minute are optimal.
- Avoid high stress loads on the crank during a gear change.
- Switch gear back in good time, e.g. before inclines.

Tyres

- Always select the right tyres for the surface type. As a general rule, narrower treads move along more easily than heavier ones. Long studs and large grooves usually have an unfavourable effect on energy consumption.
- When riding on asphalt, it is important to always use the maximum permitted tyre pressure.
- When riding off-road, on gravel tracks or soft woodland or meadow soils, it is important to remember: the lower the tyre pressure is, the greater the rolling resistance is and thus the greater electric drive system energy consumption is.

Rechargeable battery

Electrical resistance increases as the temperature drops. Battery performance is reduced. As a result, you should expect the range to be shorter than normal in winter.

Use a thermal protection sleeve on the battery in winter.

The range also depends on the battery's age, charge level and state of repair.

Maintain the battery and replace older batteries where necessary.

6.3 Error message

6.3.1 On-board computer

The on-board computer indicates whether a critical or less critical error has arisen in the drive system.

The error messages generated by the drive system can be read in the eBike Flow app and by the specialist dealer.

The rider can use a link in the eBike Flow app to display all information on errors and assistance on eliminating errors.

6.3.1.1 Less critical errors

The indicator for the selected level of assistance will flash orange in the event of less critical errors.

- ▶ Press selection button.
- ⇒ The error is acknowledged and the indicator for the selected level of assistance displays the colour for the configured level of assistance permanently.

6.3.1.2 Critical errors

The indicator for the selected level of assistance and battery level indicator flash red to indicate critical errors.

- Contact specialist dealer.
- Never connect a charger.

6.3.2 Rechargeable battery

The battery is protected against deep discharge, overcharging, overheating and short circuits by Electronic Cell Protection (ECP). In the event of a hazard, a protective circuit switches the battery off automatically. If a fault is detected in the battery, the LEDs flash on the battery level indicator.

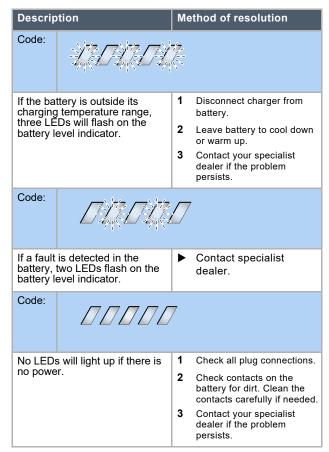

Table 35: List of battery error messages

6.4 Instruction and customer service

The supplying specialist dealer will provide customer service. Contact details can be found on the pedelec pass for these operating instructions. The specialist dealer will explain all the pedelec functions to the new owner in person, this being when the specialist dealer hands over the pedelec at the latest. These operating instructions are provided with every pedelec, so that the rider can consult them at a later stage.

The supplying specialist dealer will also perform all inspection, modifications and repairs in the future.

6.5 Adjusting the pedelec

Crash caused by incorrectly adjusted torque

If a screw is fastened too tightly, it may break. If a screw is not fastened enough, it may loosen. This will cause a crash with injuries.

Always observe the torque indicated on the screw and in the operating instructions.

Only a correctly adjusted pedelec will guarantee the desired ride comfort and health-promoting activity.

All settings must be re-configured if the body weight or maximum baggage weight changes.

6.5.1 Preparing

The following tools are required to adjust the pedelec:

almanakaranka	Tape measure
	Scales
	Spirit level
Z	Ring spanners 8 mm, 9 mm, 10 mm, 13 mm, 14 mm und 15 mm
e la companya de la compa	Torque wrench Working range 5… 40 Nm
0	Hex key 2 mm, 2.5 mm, 3 mm, 4 mm, 5 mm, 6 mm and 8 mm
0	Cross-recess screwdriver
	Slotted-head screwdriver

Table 36: Tools required for assembly

6.5.2 Determining the sitting position

The starting point for a comfortable posture is the correct position of the pelvis. If the pelvis is in the wrong position, it can cause different types of pain, e.g. in the shoulder or back.

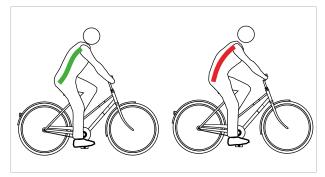

Figure 72: The pelvis is in the right position (green) or incorrect position (red)

The pelvis is in the right position if the spine forms an S-shape and a natural, easy arch.

The pelvis is positioned incorrectly if it tilts slightly backwards. As a result, the spine becomes curved and can no longer deflect to an optimal extent.

A suitable sitting position must be selected beforehand depending on the pedelec type, physical fitness and desired trip distance or speed.

It is especially advisable to check and optimise the sitting position once more before longer rides.

Position on roadster	Position on city bike	
Angle of upper body		
(black dashed line)		
Upright, almost vertical posture, back at an angle of almost 90°. Handlebars and handles are very close to the upper body.	Slightly inclined upper body, back at an angle of 60°…70°.	
Upper arm-upper body angl (red line)	e	
Extremely acute angle at around 20°. The upper arms are almost parallel to the upper body. The hands are simply placed loosely on the handlebars.	An angle of 75°–80° is optimum. Many people prefer a smaller angle of up to 60° as it requires to less effort to support the shoulders, arms and hands.	
Saddle-handlebar height difference [cm] (blue and green line)		
>10 The handlebars are posi- tioned far higher than the saddle.	10 to 5 The handlebars are posi- tioned higher than the saddle.	
Benefits		
The spine is intuitively moved into its natural S-shape. The strain on arms and hands is very slight – no effort required to support.	The upright position provides a good overview in traffic. Force can be applied to the pedals when pedalling without using much energy.	
Disadvantages		
Force is applied relatively inef- ficiently to the pedals. Weight rests exclusively on the buttocks. The spine slumps after a short time for many people (pelvic straightening).	The arms are often stretched through to the high handlebars – this leads to tense shoulders and painful hands. The spine tends to slump quickly due to the "high posi- tion".	
Fitness level and use		
Low fitness level, occasional cyclists.	Medium fitness level, city cyclists.	

Table 37: Overview of sitting positions

6.5.3 Seat post

6.5.3.1 Adjusting the seat post to body weight

Not included in price

S

Seat post are components that may be replaced after approval by the vehicle or parts manufacturer. Only seat posts that are approved for use on e-bikes may be used to replace existing ones.

Replacing with different sizes and hardnesses within a product series is permitted for seat posts. Moreover, seat posts may be exchanged if the rearward offset for the series or original range of use is not greater than 20 mm. This is because a change in load distribution outside the intended adjustment range can lead to hazardous steering performance. The seat post length must always be the same when replacing posts.

The correct functioning of the following seat posts depends on the body weight:

- Suspension seat post
- Rhomboid seat post
- Lowerable seat post

If the body weight falls below or exceeds the specifications in Section 3.1.3, either the seat post spring or, in the case of integrated seat posts, the complete seat post must be replaced with a seat post from the same product series that is appropriate for the body weight.

The preload in non-damped suspension seat posts must be adjusted in such a way that the suspension seat post does not deflect with just body weight. This prevents the suspension seat post from deflecting and bobbing intermittently at higher pedalling frequencies or if the rider pedals irregularly.

The spring stiffness can be set lower with damped suspension seat posts, thus making use of the negative deflection.

6.5.4 Saddle

Sitting discomfort due to wrong saddle

Around 50% of all pedelec riders experience discomfort due to incorrect sitting.

- Adjust the saddle (see Section 6.5.5).
- Check settings.
- If the saddle does not fit or causes pain, replace existing saddle with a large one which matches the sit bone distance.

6.5.4.1 Replacing the saddle

Not included in price

S

Saddles are components that may be replaced after approval by the vehicle or parts manufacturer. Replacing different sizes within a product series is permitted for saddles.

Moreover, saddles may be exchanged if the rearward offset to the series or original range of use is not greater than 20 mm since a change in load distribution outside the intended adjustment range can lead to critical steering performance. The saddle shape plays a role here. Only saddles that are approved for use on e-bikes may be used to replace the existing ones.

If the pre-mounted saddle is uncomfortable or causes pain, a saddle optimised to the rider's physique must be used. To do so:

- Determine the saddle shape (see Section 6.5.4.1)
- Establish the saddle width (see Section 6.5.4.2 or 6.5.4.3)
- Select the saddle hardness (see Section 6.5.4.5)
- · Check the saddle.

6.5.4.2 Determining saddle shape

Ladies' saddle

To distribute the pressure optimally over the female bone structure in the seat area, a ladies' saddle should:

- have a relief opening far to the front
- have a wide, V- shaped saddle edge

Figure 73: Example: Ergotec ladies' saddle

Men's saddle

Numbness when pedalling is often caused by high pressure in the sensitive perineal area. If the saddle is adjusted incorrectly, too narrow or too hard, the nose of the saddle presses directly onto the genitals. Blood circulation deteriorates.

The genitals on the outside are seldom the cause of discomfort since they can move out of the way and are not compressed by bone structures.

You should always consult a doctor if you have problems with your prostate. After a prostate operation or inflammation, it is advisable to avoid any pressure in the perineal area and take a longer break from pedelec riding after consulting your doctor. A prostate saddle should then be used. This reduces the pressure in the perineal area by up to 100%.

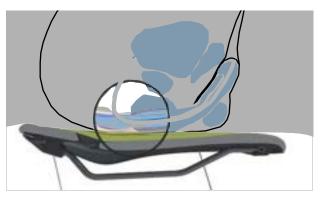

Figure 74: Pressure points on a saddle, male anatomy

To distribute the pressure on the male bone structure in the seat area optimally, the saddle should:

- Shift the pressure to the sitting bones and parts of the pubic arches
- The perineal area must remain as free of pressure as possible

Figure 75: Example: Ergotec men's saddle

6.5.4.3 Determining minimum saddle width with corrugated cardboard

- 1 Place corrugated cardboard on a flat, hard, unpadded seat.
- 2 Sit in the middle of the corrugated board.

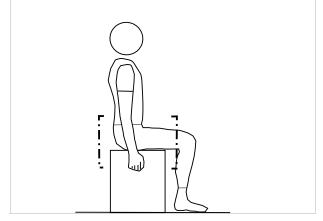

Figure 76: Sitting on the corrugated board

- **3** Pull the seat with your hands and arch your back.
- ⇒ The sitting bones are more prominent and stand out more clearly on the corrugated cardboard.
- 4 Trace the outer edges of the two depressed areas in a circle.
- **5** Determine the centre of both circles and mark them with a dot.
- 6 Measure the distance between the two centres.

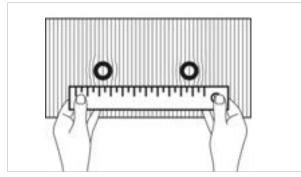

Figure 77: Measuring the distance

- ⇒ The distance between the two centre points is the sit bone distance and corresponds to the minimum saddle width.
- 7 Calculate saddle width (see Section 6.5.4.4).

- **5** 6.5.4.4 Determining minimum saddle width with gel cushion
 - **1** Smooth gel cushion.
 - 2 Place gel cushion on a flat, hard, unpadded seat.
 - 3 Sit in the middle of the gel cushion.

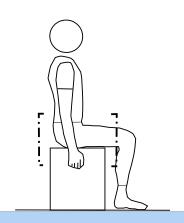

Figure 78: Sitting on the gel cushion

Pull the seat with your hands and arch your back.

4 The sitting bones are more prominent and stand out more clearly on the gel cushion.

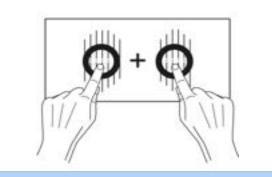

Figure 79: Adding the centres together

- 5 Determine the centres of both sitting bones.
- 6 Add the two values together.
- ⇒ The total of the values is the sitting bone distance and corresponds to the minimum saddle width.
- 7 Calculate saddle width (see Section 6.5.4.4).

6.5.4.5 Calculating the saddle width

Depending on the position, the following value is added to the minimum saddle width.

Position on roadster	+ 4 cm
Position on city bike	+ 3 cm
Position on trekking bike	+ 2 cm
Position on sports bike	+ 1 cm
Triathlon/time trials	+ 0 cm

Table 38: Calculating the saddle width

6.5.4.6 Selecting the saddle hardness

Saddles are available in a wide range of hardnesses and must be adapted to the pedelec's use:

- A pedelec that is mainly used for commuting in jeans calls for a soft saddle.
- A pedelec that is mainly used for sports riding with padded cycling shorts requires a hard saddle.

If the degree of hardness is not suitable, a new saddle must be selected.

6.5.4.7 Adjusting the saddle hardness

Only applies to pedelecs with this equipment

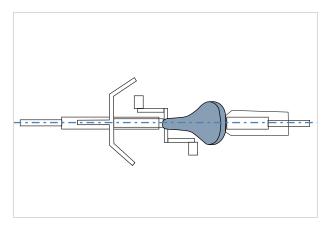

In air cushion saddles, the hardness of the saddle can be adjusted using the pump valve beneath the seat surface.

Soft	Pump 3 times
Medium	Pump 5 times
Hard	Pump 10 times

Table 39: VELO air cushion saddle settings

6.5.4.8 Straighten saddle

Position saddle in direction of travel. In doing so, align the tip of the saddle with the top tube.

6.5.4.9 Adjusting the saddle height

- ✓ To adjust the saddle height safely, either:
- Push the pedelec near to a wall so that the pedelec rider can lean on the wall to support themselves or
- Ask another person to hold the pedelec.
- Use the seat height formula to roughly set the saddle height:
 Seat height (SH) = inner leg length (I) × 0.9
- 2 Climb onto the bicycle.
- **3** Place your heel on the pedal and extend your leg, so that the pedal is at the lowest crank rotation point. Your knee should now be fully extended.

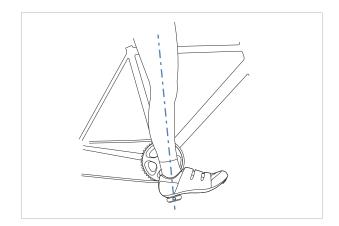

Figure 81: Heel method

- 4 Take a test ride.
- ➡ Pedelec riders sit straight on the saddle at an optimal saddle height.
- If the pelvis moves to the left and right as you pedal, the saddle is too high.
- If your knees are painful after a few kilometres, the saddle is too low.
- Position the seat post according to needs if necessary. Adjust the seat height with the quick release.
- **5** Open the quick release on the seat post to change the seat height (1). To do so, push the clamping lever away from the seat post (3).

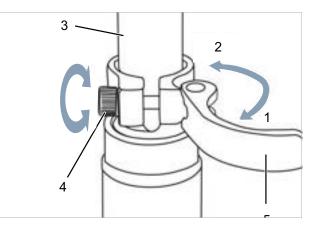

Figure 82: Opening the seat post quick release

6 Set the seat post to the required height.

Crash caused by an excessively high seat post setting

A *seat post* with is set too high will cause the *seat post* or the *frame* to break. This will cause a crash with injuries.

Do not pull the seat post out of the frame beyond the minimum insertion depth marking.

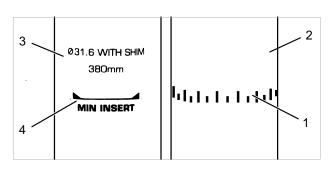

Figure 83: Detailed view of the seat post – examples of the minimum insertion depth marking

- 7 To close it, push the *seat post clamping lever* as far as it will go into the *seat post* (2).
- 8 Check the clamping force of the quick releases.
- 6.5.4.10 Setting the saddle height with the remote control

Use the seat height formula to set the saddle height:

Seat height (SH) = inner leg length (I) × 0.9

Notice

If you are unable to achieve the required saddle height, the seat post must be lowered further into the seat tube. The seat post Bowden cable must be tightened in the frame up to the remote control to the same length as the seat post was lowered. If this is not possible, contact your specialist dealer.

Lowering the saddle

- 1 Sit on the saddle.
- 2 Press the remote control operating lever.
- ⇒ The seat post will lower.
- 3 Release the remote control operating lever when you have reached the desired height.

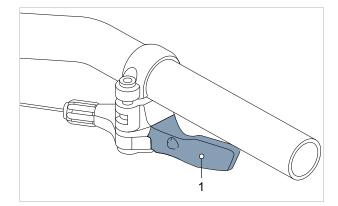

Figure 84: Remote control operating lever (1)

Raising the saddle

- 1 Remove any pressure from the saddle.
- 2 Press the remote control operating lever.
- ⇒ The seat post will rise.
- **3** Release the remote control operating lever when you have reached the desired height.

6.5.4.11 Adjusting the saddle position

The saddle can be shifted on the saddle frame. The right horizontal position ensures an optimal leverage position for legs. This prevents knee pain and painful incorrect pelvis positions. If you have displaced the saddle more than 10 mm, you need to adjust the saddle height again since both settings affect one another.

- ✓ The saddle setting must only be made when the bicycle is stationary.
- $\checkmark\,$ To set the saddle position, either:
- Push the pedelec near to a wall so that the pedelec rider can lean on the wall to support themselves or
- Ask another person to hold the pedelec.
- Move the saddle within its permitted displacement range only (marked on the saddle stay).
- 1 Climb onto the pedelec.
- 2 Place the pedals into the vertical position with your feet.
- Pedelec riders are adopting the optimal saddle position if the perpendicular line from the kneecap runs through the pedal axle.
- If the perpendicular line crosses behind the pedal, bring the saddle further forward.
- If the perpendicular line crosses in front of the pedal, bring the saddle further back.

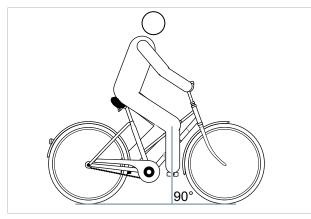

Figure 85: Knee cap perpendicular line

3 Unfasten and adjust the designated screw connections, and clamp them with the maximum tightening torque for the saddle clamping screws.

6.5.4.12 Adjusting the saddle tilt

The saddle tilt must be adjusted to the seat height, the saddle and handlebar position, and the saddle shape to ensure an optimum fit. The seating position can be optimised in this way if needed.

The saddle prevents pedelec riders from slipping backwards or forwards when placed in a horizontal position. This prevents seat problems. In any other position, the tip of the saddle may press uncomfortably into the crotch area. It is also recommended that the centre of the saddle is exactly straight. This ensures that the rider is seated with their sit bones on the wide rear part of the saddle.

- **1** Adjust the saddle tilt to horizontal.
- **2** Position saddle middle so that it is completely straight.

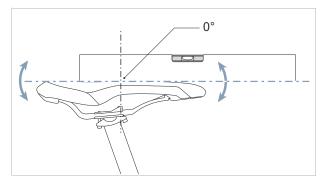

Figure 86: Horizontal saddle tilt with 0° tilt in the centre of the saddle

- ➡ Pedelec riders sit comfortably on the saddle and do not slip backwards or forwards.
- **3** Pedelec riders tend to slip forwards on the narrow part of the saddle, adjust the riding position (see Section 6.6.2.3) or tilt the saddle very slightly backwards.

6.5.4.13 Checking saddle stability

 Check saddle stability after adjusting it (see Section 7.5.13).

6.5.5 Handlebars

6.5.5.1 Replace handlebars

Not included in price

Handlebars are components that may be replaced after approval by the vehicle or parts manufacturer. Only handlebars that are approved for use on e-bikes may be used to replace the existing ones. Handlebars may be replaced if the cable and/or line lengths do not need to be changed. A change in riding position is allowed within the original cable length. Furthermore, the load distribution on the pedelec changes considerably and may potentially lead to critical steering performance.

- Check handlebar width and hand position.
- Have handlebars replaced at the specialist dealer's if necessary.

6.5.5.2 Adjusting the handlebar width

The handlebar width should be as wide as the rider's shoulders as a minimum. This is measured from mid-point to mid-point on the hand contact surfaces.

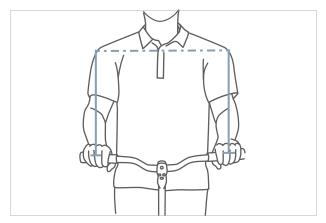

Figure 87: Determining the optimal handlebar width

The wider the handlebars are, the more control they provide, although wide handlebars require greater supporting force. Wider handlebars are particularly useful to ensure a safer ride for loaded touring bikes.

6.5.5.3 Adjusting the hand position

The hand is an optimal position on the handlebars when the forearm and hand are in a straight line, i.e. the wrist is not bent. In this way, the nerves are not pinched and do not cause pain.

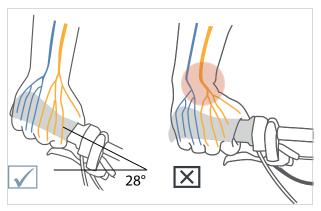

Figure 88: Distribution of nerves with curved and straight handlebars

The narrower the shoulders are, the greater the bend of the handlebars should be (maximum 28°).

Straight handlebars are advisable for sports bikes (e.g. MTB). They support direct steering behaviour, but lead to peaks in pressure and greater muscular strain on the arm and shoulder muscles.

6.5.5.4 Adjusting the handlebars

The handlebars and their position determine the posture that the pedelec rider adopts on the pedelec.

- 1 After selecting the riding position (see Section 6.6.2.1), determine the angle of the upper body and upper arm.
- 2 Pre-tension the back muscles when adjusting the handlebars. The only way to stabilise the spine and protect it from excessive strain is with the back and abdominal muscles pretensioned. Passive muscles are not able to perform this important task.
- **3** Set the required handlebar position by adjusting the stem height and angle (see Section 6.6.6).
- 4 After adjusting the handlebars, check the saddle height and riding position again. The position of the pelvis on the saddle may have changed when the handlebars were adjusted. This can have considerable impact on the position of the hip joint due to the pelvis tilting and may change the usable leg length on the saddle support by up to 3 cm.
- **5** Correct the saddle height and riding position if necessary.

6.5.6 Stem

6.5.6.1 Replacing the handlebars

Not included in price

Handlebar-stem units are components that may be replaced after approval by the vehicle or parts manufacturer.

Only units that are approved for use on e-bikes may be used to replace the existing ones. A stem must be replaced if cable and/or line lengths do not need to be changed.

A change in riding position is allowed within the original cable length. Furthermore, the load distribution on the pedelec changes considerably and may potentially lead to hazardous steering performance.

6.5.6.2 Adjusting the handlebar height with quick release

Only applies to pedelecs with this equipment

1 Open the stem clamping lever.

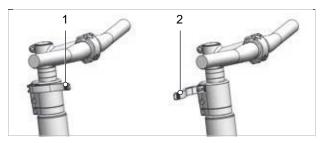

Figure 89: Open (2) and closed (1) stem clamping lever; All Up used as an example

2 Pull out the handlebars to the required height. Observe minimum insertion depth.

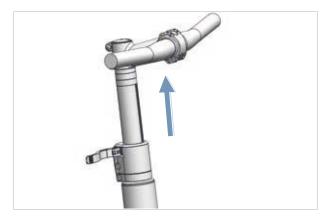

Figure 90: Pulling the handlebars upwards; All Up used as an example

3 Close the stem clamping lever.

6.5.6.3 Checking the stem stability

- Hold handlebars firmly after adjusting the saddle. Press full body weight on the handlebars.
- ⇒ The handlebars remain stable in their position.
- 6.5.6.4 Adjusting the quick release clamping force

Crash caused by incorrectly set clamping force

Applying excessive clamping force damages the quick release. Insufficient clamping force will result in unfavourable transmission of force. This can cause components to break. This will cause a crash with injuries.

Never fasten a quick release using a tool (e.g. hammer or pliers).

If the *handlebar clamping lever* stops before reaching its end position, unscrew the *knurled nut*.

- Tighten the knurled nut on the seat post if the seat post clamping lever's clamping force is not effective enough.
- Contact your specialist dealer if the clamping force cannot be set.

6.5.6.5 Setting the quill stem

Only applies to pedelecs with this equipment

In the case of a quill stem, the stem and fork steerer form a permanently interconnected component, which is clamped in the fork steerer. The stem and shaft must be replaced together.

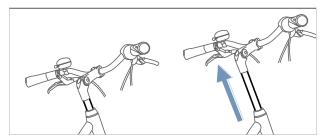

Figure 91: Adjusting the quill stem height

- 1 Undo screw.
- 2 Pull quill stem out.
- 3 Tighten screw.

6.5.6.6 Adjusting the Ahead stem

Only applies to pedelecs with this equipment

In the case of an Ahead stem, the stem is placed directly on the fork steerer, which protrudes over the frame.

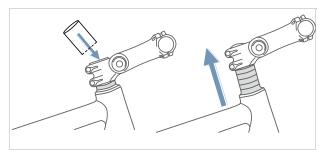

Figure 92: Raising the Ahead stem by fitting spacer rings

The handlebar height is adjusted once during production using spacer rings. The part of the fork steerer protruding is then cut off. The handlebar stem can then no longer be set higher, but only slightly lower.

6.5.6.7 Adjusting the angle-adjustable stem

Only applies to pedelecs with this equipment

Angle-adjustable stems are available in different lengths for quill and Ahead stems.

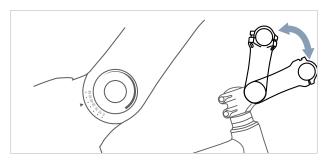

Figure 93: Different versions of angle-adjustable stems

Adjusting the stem angle (c) changes both the distance from the upper body to the handlebars (b) and the handlebar height (a).

Figure 94: City bike (blue) and trekking bike position (red) by changing the angle

6.5.7 Handles

6.5.7.1 Replacing the handles

Not included in price

Handles with bolt clamps are components which may be replaced without approval. Only handles that are approved for use on e-bikes may be used to replace the existing ones.

If there is pain or numbness in the index, middle finger or thumb, this may be due to excessive pressure on the exit of the carpal tunnel. On longer rides, this can increasingly cause hand fatigue and make it more and more difficult to maintain a correct hand position.

In the case of ergonomically shaped handles, the palm rests on the anatomically shaped handle. A greater contact surface means that the pressure is more evenly distributed. Nerves and vessels are no longer squeezed in the carpal tunnel.

Moreover, the hand is supported and held in the correct position so that the hand can no longer bend.

If the pre-mounted handles are uncomfortable or cause pain or numbness in the index, middle finger or thumb, ergonomic handles, bar ends or multi-position handlebars should be used.

6.5.7.2 Adjusting ergonomic handles

Only applies to pedelecs with this equipment

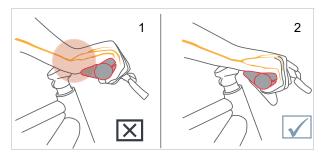

Figure 95: Incorrect (1) and correct (2) position of the handle

- **1** Undo handle clamping screw.
 - 2 Turn handle into the right position.
 - **3** Fasten handle clamping screw with the torque value indicated there.
 - ⇒ The handles are firmly fastened.
 - ➡ The pull-off force of the handles is at least 100 N in the roadster, city and trekking positions, and at least 200 N in the sporty position.
 - 6.5.7.3 Checking handlebar stability
 - See Section <u>7.5.12</u>.

6.5.8 Tyres

6.5.8.1 Replacing tyres

Not included in price

Different tyres need to be used when the area of use is changed, more weight or greater puncture protection is added, and greater acceleration or more dynamic cornering is used.

Tyres are may only be replaced after approval by the vehicle or parts manufacturer.

Tyres may be replaced if

- They are approved for use on e-bikes
- They comply with ETRTO dimensions
- They have the same load capacity as a minimum
- They have a comparable level of puncture protection as a minimum

6.5.8.2 Adjust tyre pressure

The correct tyre pressure largely depends on the weight load on the tyres. This load is determined by the pedelec's tare weight, the rider's body weight and the luggage load.

Unlike cars, the weight of the vehicle has little impact on the total weight. Moreover, the personal preferences for low rolling resistance or a high degree of suspension comfort vary a great deal.

It is important to remember that

- the higher the tyre pressure is, the lower the wear, rolling resistance and the risk of breakdown are.
- the lower the pressure in the tyre is, the greater the comfort and grip that the tyre offers is.

In the case of pedelecs used on the road, the rule is the greater the tyre pressure is, the lower the tyre rolling resistance is. The risk of breakdown is also lower when the pressure is high. A permanently excessively low tyre pressure often leads to premature wear in the tyre. Cracking in the side wall is a typical consequence of very low tyre pressure. Abrasion is also unnecessarily high.

On the other hand, a tyre can absorb road impacts more effectively at a low pressure.

As a general rule, wide tyres are operated at a lower tyre pressure. They provide the option of exploiting the advantages of the lower tyre pressure without the serious disadvantages it causes with regard to wear, rolling resistance and breakdown protection.

- ✓ Never exceed or go below the minimum and maximum pressure limits indicated on the tyre.
- 1 Pump the tyre to the recommend tyre pressure.

Tyre width	Tyre pressure in bar for body weight		
ryre width	approx. 60 kg	approx. 80 kg	approx. 110 kg
25 mm	6.0	7.0	8.0
28 mm	5.5	6.5	7.5
32 mm	4.5	5.5	6.5
37 mm	4.0	5.0	6.0
40 mm	3.5	4.5	6.0
47 mm	3.0	4.0	5.0
50 mm	2.5	4.0	5.0
55 mm	2.0	3.0	4.0
60 mm	2.0	3.0	4.0

Table 40: SCHWALBE recommend tyre pressure

2 Perform a visual check on tyres.

Figure 96: Correct tyre pressure. The tyre is barely deformed under the load of the body weight

Figure 97: Far too little tyre pressure

6.5.9 Brake

The handbrake grip distance can be adjusted to ensure that it can be reached more easily. The pressure point can also be adjusted to the pedelec rider's preferences.

6.5.9.1 Replacing brakes

Not included in price

The braking system components may only be replaced with original components.

In the case of disc brake linings, the lining compound may be adapted to the surface and the rider's experience.

6.5.9.2 Retracting the brake linings

Disc brakes require wearing-in time. The braking force increases over time. The braking force is increased during break-in time. This is also the case when the brake pads or brake discs are replaced.

- 1 Accelerate pedelec to 25 km/h.
- 2 Brake pedelec until it comes to a halt.
- 3 Repeat process 30 to 50 times.
- ⇒ The disc brake is retracted and provides optimal braking power.

6.5.9.3 Change handbrake position

Having the handbrake in the correct position prevents the rider from stretching their wrist too far. Moreover, the brake can also be operated without any discomfort and without changing the handle position or releasing the handle.

- ✓ Apply handbrake with the third finger phalanx in bursts to brake gently.
- ✓ The setting for the middle finger is used for pedelec riders who brake with their middle finger or with two fingers.
- 1 Position your hand on the handle in such a way that the outer heel of the hand is flush with the end of the handlebar.
- **2** Extend the index finger (about 15°).

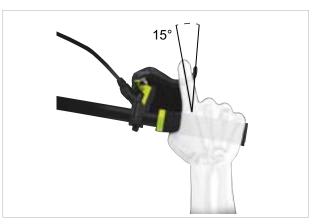

Figure 98: Handbrake position

3 Push handbrake outwards until the third finger phalanx sits in the recessed grip.

6.5.9.4 Change handbrake inclination angle

The nerves that pass through the carpal tunnel are connected to the thumb and the index and middle fingers. An excessively steep or excessively flat brake angle will cause the wrist to bend, thus narrowing the carpal tunnel. This can cause numbness and tingling in the thumb and index and middle fingers.

 Calculate the difference between the height of the handlebars and the saddle height to determine the saddle-handlebar height difference.

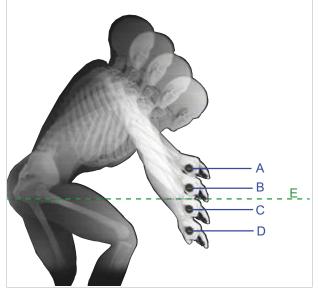

Figure 99: Example of 4 different handlebar heights (A, B, C and D) and the saddle height (E)

Calculation	Saddle-handlebar height difference [mm]
A – E	>10
B – E	0 +10
С — Е	010
D — E	< -10

Table 41: Examples of saddle-handlebar height difference

Adjust the angle of the handbrake so that it forms a natural extension of the forearm.

2 Set the brake lever angle as indicated in the table.

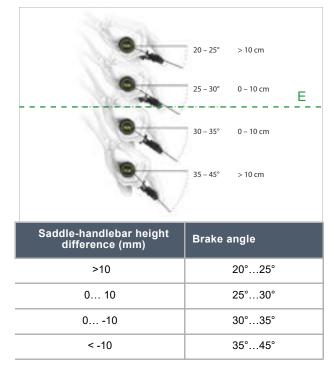

Figure 100: Brake angle

- 6.5.9.5 Determining the grip distance
- **1** Measure hand size using the grip distance gauge.
- **2** Adjust the grip distance at the pressure point based on the hand size.

Figure 101: Handbrake positioning

Hand size	Grip distance (cm)
S	2
М	3
L	4

6.5.9.6 Grip distance on SHIMANO ST-EF41 handbrake

Only applies to pedelecs with this equipment

Notice

If the setting screw is fully removed, components inside the handbrake will also be permanently twisted off as well. The handbrake will be permanently damaged.

Never completely remove setting screws.

The handbrake position can be adjusted to the rider's requirements.

- ▶ Undo 2 mm setting screw anti-clockwise.
- ⇒ The handbrake will move closer to the handlebar grip.
- ► Turn 2 mm setting screw clockwise.
- ⇒ The handbrake will move away from the handlebar grip.
- ➡ This adjustment affects the position of the brake linings.
- Re-adjust the brake linings after adjustment.

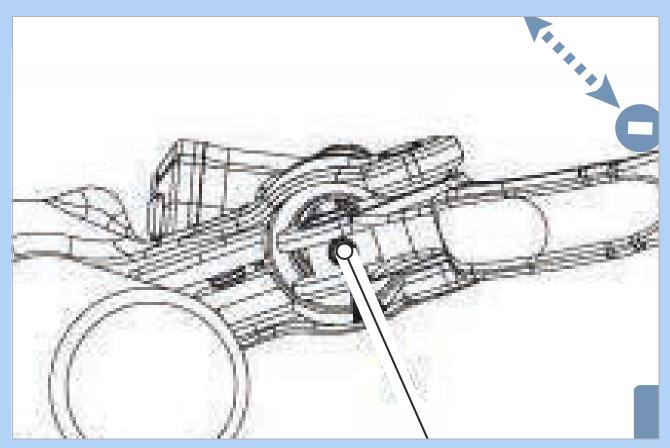

Figure 102: Setting screw position (1)

6.5.10 Gear shift

Adjust the position of the gear shift to the pedelec riders' needs.

- **1** Undo attachment screw.
- 2 Place control panel or shifter into the position where the pedelec rider can use the control panel or the shifter with their thumb and/or index finger. The shifter must never block the handbrake.
- 3 Tighten attachment screw.

6.5.10.1 Replacing the gear shift

Not included in price

100

All gear shift components (rear derailleur, shifter, twist grip, shift cables and sleeves) may be replaced provided that:

- They are approved for use on e-bikes
- All gear shift components are suitable for the number of gears
- All gear shift components are compatible with one another

It is permitted to change from an electronic gear shift variant to a mechanical one.

It is prohibited to change from a mechanical gear shift variant to an electronic one.

6.5.10.2 Adjusting the SHIMANO shifter

Only applies to pedelecs with this equipment

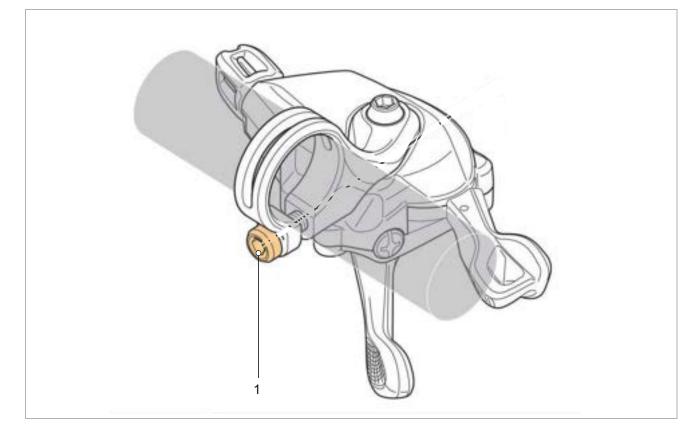

Figure 103: Position of attachment screw in SHIMANO shifter (1)

6.5.11 Suspension and damping

Suspension and damping can be adjusted to the rider's weight in up to six increments, depending on the suspension system.

	For pedelecs with compon		components only	
Sequence	Adjustment	Section	Suspension fork	Rear frame damper
1	Adjust the suspension fork sag	6.3.13	x	
2	Adjust the rear frame damper sag	6.3.14		x
3	Adjust the suspension fork rebound damper	6.3.15	x	
4	Adjust the rear frame damper rebound damper	6.3.16		x
5	Adjust the rear frame damper compression damper	6.3.17		x
6	The fork compression damper is adjusted to the terrain while riding	6.11		x

Table 42: Correct order for suspension and damping adjustment

6.5.12 Adjusting sag (fork)

Crash caused by incorrectly set suspension

If the suspension is set incorrectly, the fork may become damaged, meaning problems may occur when steering. This will cause a crash with injuries.

- Never ride without air in air suspension forks.
- Never use the pedelec without adjusting the suspension fork to the body weight.

Adjustments on the chassis change ride performance significantly. The rider needs to get used to the pedelec and break it in to prevent accidents. Sag (also referred to as negative deflection) is the percentage of the total deflection that is compressed by the rider's body weight, including equipment (such as a backpack), the seating position and frame geometry. Sag occurs whether you are actually riding or not.

The pedelec rebounds at a controlled speed if it is optimally adjusted. The wheel stays in contact with the ground when passing over bumps (blue line). The fork head, handlebars and body follow terrain (green line) when riding over bumps. The suspension motion is predictable and controlled.

Figure 104: Optimum fork ride performance

When optimally adjusted, the fork counteracts deflection on hilly terrain and stays higher in its deflection range.

This allows the rider to maintain the same speed more easily on hilly terrain.

Figure 105: Optimum fork ride performance on hilly terrain

When optimally adjusted, the fork deflects quickly and unhindered when the bike hits bumps and absorbs a bump. Traction is retained (blue line). The fork responds quickly to the bump. The headset and handlebars rise slightly when absorbing a bump (green line).

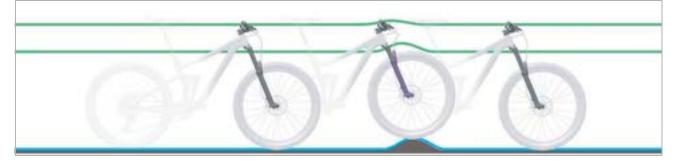

Figure 106: Optimum fork ride performance over bumps

The sag depends on the position and body weight and should be set based on preferences and on how the pedelec is used.

Greater sag

A greater sag increases sensitivity to bumps, thus producing greater suspension motion. A greater sensitivity to bumps ensures more comfortable ride performance and is used on pedelecs with longer deflection.

Decreased sag

A decreased sag reduces sensitivity to bumps, thus producing less suspension motion. A lower sensitivity to bumps ensures a firmer, more efficient ride performance and is generally used on pedelecs with shorter deflections. The adjustment shown here represents a default setting. The default settings should change, adapted to suit the surface and preferences.

It is advisable to make a note of the default settings. These can then be used as a starting point for subsequent optimised settings and as a safeguard against unintentional changes.

6.5.12.1 Adjusting the sag for the SR SUNTOUR steel suspension fork

Only applies to pedelecs with this equipment

You can pre-tension the steel suspension to adjust to the rider's weight and their preferred

riding style. It is not the coil spring hardness which is adjusted; it is its preload.

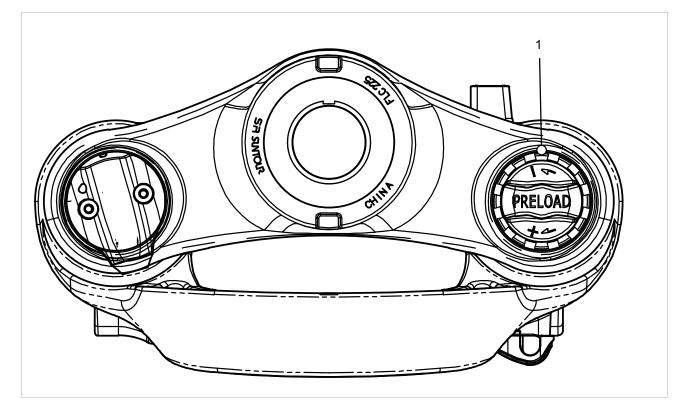

Figure 107: Example with SR SUNTOUR, sag setting wheel on the fork crown

- **1** Put on normal cycling clothing (including baggage).
- 2 Turn the **sag setting wheel** (see Section 3.3.11.1) until the required sag is reached.
- ► Turn the sag setting wheel clockwise.
- ⇒ The spring preload is increased.
- ► Turn the **sag setting wheel** anticlockwise.
- ⇒ The spring preload is reduced.
- **3** If you are unable to achieve the required degree of hardness, contact your specialist dealer.

6.5.13.2 Replacing the rear light and (spoke)

The rear light and (spoke) reflector may be

replaced without special approval provided they comply with the laws of the country where the

reflector

Not included in price

pedelec will be ridden.

6.5.13 Riding light

6.5.13.1 Replacing the headlight

Not included in price

S

Headlights may only be replaced after approval by the manufacturer or system provider.

6.5.13.3 Setting the riding light

Example 1

If the headlight is positioned too high, oncoming traffic will be dazzled. This can cause a serious accident with fatalities.

L'S

Example 2

Positioning the headlight correctly can ensure that oncoming traffic is not dazzled and no-one is put at risk.

Example 3

If the headlight is positioned too low, the space ahead is not illuminated to an optimum extent and the rider's vision is reduced in the dark.

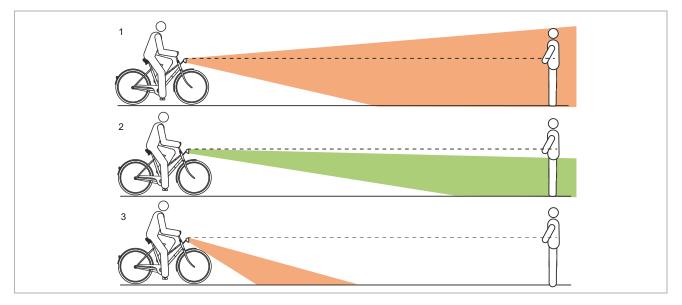

Figure 108: Light positioned too high (1), correctly (2) and too low (3)

6.5.13.4 Adjusting the headlight

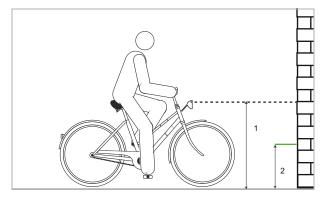

Figure 109: Measuring on the wall

- 1 Position the pedelec so that its front is facing a wall.
- **2** Mark the height of the headlight (1) on the wall with chalk.
- **3** Mark half the height of the headlight (2) on the wall with chalk.
- 4 Place pedelec 5 m in front of the wall.
- 5 Stand the pedelec up straight.
- **6** Hold the handlebars straight with both hands. Do not use the kickstand.
- 7 Switch on riding light.

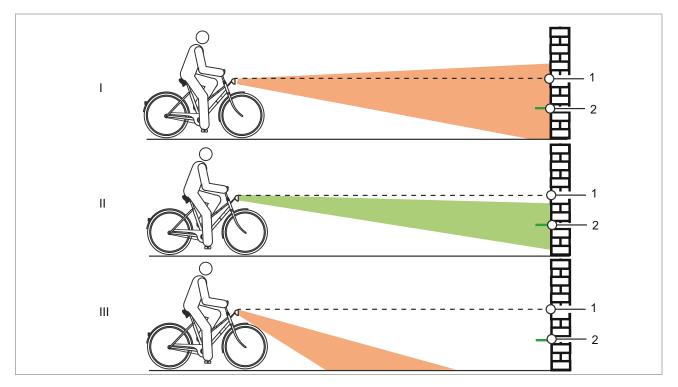

Figure 110: Light positioned too high (1), correctly (2) and too low (3)

- 8 Check the position of the light beam.
- (I) if the upper edge of the light beam is above the headlight height mark (1), the riding light will dazzle. The headlight must be positioned lower.
- If the mid-point of the light beam is on or slightly below the mark showing half the height of the headlight (2), the lighting is optimally positioned.
- ▶ If the light beam is in front of the wall, move the headlight up.

6.5.14 On-board computer

A smartphone with the eBike Flow application is required to use all drive system functions. The pedelec is connected to the app via a Bluetooth® connection.

6.5.14.1 Creating a user account

The rider needs to register online and create a user account first.

Registering on a PC

- 1 Create the user account on the BOSCH website.
- 2 Enter all the details required for registration.

Registering on a smartphone

Apple iPhones

Download the Bosch eBike Flow smartphone app from the App Store free of charge.

Android devices

Download the eBike Flow smartphone app from the Google Play Store free of charge.

6.5.14.2 Connecting the on-board computer to a smartphone

- ✓ The BOSCH eBike Flow app is downloaded onto the smartphone.
- ✓ The drive system is switched on.
- ✓ The pedelec is stationary.
- 1 Launch app.
- 2 Select the <My eBike> tab in the app.
- **3** Select the <Add new eBike device> tab in the app.
- 4 Press the **On-Off button on the pedelec** for longer than 3 seconds.
- ➡ The top bar on the control panel battery level indicator flashes blue.
- ⇒ The on-board computer will switch the Bluetooth® Low Energy connection on and change to pairing mode.
- 5 Release the On-Off button.
- 6 Accept the connection prompt in the app.
- 7 Follow the instructions on the display.
- ➡ The user data will be synchronised once the pairing process is complete.

6.5.14.3 Update software

Software updates are managed by the Bosch eBike Flow smartphone app.

- ✓ The on-board computer is now connected to the smartphone.
- ✓ The drive system is switched on.
- ✓ The pedelec is stationary.
- A new software update is downloaded automatically onto the on-board computer.
- ➡ The battery level indicator will flash green during updates to show how the update is progressing.
- ⇒ The system is restarted after an update has completed successfully.

6.5.14.4 Activating activity tracking

- ✓ Your location will only be logged if the on-board computer is connected to the Bosch eBike Flow smartphone app.
- Agree to activities being collected and stored on the platform or in the app.
- All the pedelec's activities are stored and displayed on the platform and in the app.

6.5.14.5 Setting up the lock function (optional)

The user account can be used to activate the lock function. This will create a digital key on the smartphone, which is required to start the drive system.

Once the lock function is switched on, the pedelec can only be put into use if:

- the configured smartphone is switched on,
- the smartphone is charged sufficiently and
- the smartphone is directly next to the control panel.

If the key is not immediately verified on the smartphone, the battery level indicator and the display of selected level of assistance on the pedelec flash white to indicate a search for the key.

If the key is found, the battery level indicator flashes white. The last configured level of assistance is displayed. If the key cannot be found on the smartphone, the pedelec drive system switches off. The indicators on the control panel go off.

As the smartphone is only used as a contactless key to switch on the pedelec, the battery and control panel can still be used on another, unblocked pedelec.

6.6 Accessories

Not included in price

6.6.1 Child seat

Child seats may only be used with the vehicle manufacturer's approval and only if they are approved for use on e-bikes.

Crash caused by incorrect child seat

Pannier racks with a maximum load capacity under 27 kg and the down tube are unsuitable for mounting child seats and may break. Such an incorrect position may cause a crash with serious injuries for the pedelec rider or child.

Never attach a child seat to the saddle, handlebars or down tube.

Crash caused by improper handling

When using child seats, the pedelec's handling characteristics and stability change considerably. This can cause a loss of control, a crash and injuries.

You should practice how to use the child seat safely before using the pedelec in public spaces.

Risk of crushing due to exposed springs

The child may crush his/her fingers on exposed springs or open mechanical parts of the saddle or the seat post.

- Never install saddles with exposed springs if a child seat is being used.
- Never install suspension seat posts with open mechanical parts or exposed springs if a child seat is being used.

Notice

- Observe the legal regulations on the use of child seats.
- Observe the operating and safety instructions for the child seat system.
- Never exceed the maximum permitted total weight.

The specialist dealer will advise you on which child seat system is suitable for the child and the pedelec.

The specialist dealer must install the child seat the first time to ensure that it is safely fitted.

When installing a child seat, it must be ensured that:

- the seat and the seat fastening are suitable for the pedelec
- all components are installed and securely fastened
- shift cables, brake cables, hydraulic and electrical cables are adjusted as necessary
- the pedelec rider has optimum freedom of movement
- the maximum permitted total weight of the pedelec is observed.

The specialist dealer will provide instruction on how to handle the pedelec and the child seat.

6.6.2 Trailer

Trailers may only be used with the vehicle manufacturer's approval and only if they are approved for use on e-bikes.

Crash caused by brake failure

The braking distance may be longer if the trailer is carrying excessive load. The long braking distance can cause a crash or an accident and injuries.

Never exceed the specified trailer load.

Notice

- ► The *operating* and safety instructions for the trailer system must be observed.
- Observe the statutory regulations on the use of bicycle trailers.
- Only use type-approved coupling systems.

A pedelec which is approved for towing a trailer will bear an appropriate adhesive label. You may only use trailers with a tongue load and weight which do not exceed the permitted values.

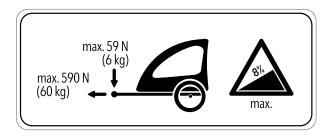

Figure 111: Trailer sign

The specialist dealer will advise you on which trailer system is suitable for the pedelec. The specialist dealer must install the trailer the first time to ensure that it is fitted safely.

6.6.2.1 Approval for trailer with Enviolo hub

Only applies to pedelecs with this equipment

Only compatible bicycle trailers are approved for ENVIOLO hub gears.

KETTLER

KETTLER Quadriga child trailer.

6.6.2.2 Approval for trailer with ROHLOFF hub

Only applies to pedelecs with this equipment

ROHLOFF Speedhub 500/14

As a basic rule, it is permitted to use a trailer in combination with the ROHLOFF SPEEDHUB 500/14.

There must be **no component contact** with the cover of the ROHLOFF E-14 gear shift unit caused by pressure or tension at any time during assembly or when riding with the trailer **under any circumstances**.

Collision causing possible damage to the ROHLOFF E-14 gear shift unit can be avoided with suitable washers or special axle adapters (spacers or polygon) from the coupling manufacturer concerned.

Speedhub with A-12

Risk of an accident

The A-12 attachment screw has a very low screwin depth. The screw or the thread in the axle plate can be damaged or ripped out if a trailer hitch is fitted directly onto the axle or the A-12 attachment screw. This may cause an accident with injuries.

Never fit a trailer hitch directly on the axle and the A-12 attachment screw to a ROHLOFF Speedhub with an A-12 axle system in a 12 mm quick release axle frame.

6.6.3 Pannier rack

§

Front and rear pannier racks are only permitted with the vehicle manufacturer's approval and only if they are approved for use on e-bikes.

The specialist dealer will advise on choosing a suitable pannier rack.

The specialist dealer must install the pannier rack the first time to ensure that it is safely fitted.

When installing a pannier rack, the specialist dealer makes sure that the fastening mechanism is suitable for the pedelec and that all components are installed and firmly fastened. They will also ensure that shift cables, brake cables, hydraulic lines and electrical cables are adjusted as necessary, the person riding has optimum freedom of movement and the pedelec's maximum permitted total weight is not exceeded.

The specialist dealer will provide instruction on how to handle the pedelec and the pannier rack.

6.6.4 Panniers and cargo boxes

Panniers and cargo boxes are permitted if they are approved for use on e-bikes.

- Pay attention when loading the pannier rack and ensure correct load distribution.
- The maximum permitted total weight must not be exceeded during use.
- Use a paint protection film when attaching panniers. This will reduce abrasion on paint and wear on components.

The following panniers and cargo boxes are recommended:

Description	Article number
Protective cover for electrical components	080-41000 ff
Panniers, system component	080-40946
Rear wheel basket, system component	051-20603
Bicycle box, system component*	080-40947

Table 43: Recommended panniers and cargo boxes

6.6.5 Front baskets

Take care with front baskets because their load
 distribution is not fixed. They are only permitted
 with the vehicle manufacturer's approval and
 only if they are approved for use on e-bikes.

6.6.6 Bar ends

Handlebar ends are permissible provided they are professionally fitted to face the front at a specialist shop and only if they are approved for use on e-bikes. They must not seriously alter load distribution.

6.6.7 Kickstands

Kickstands are permitted if they are able to bearthe weight of the pedelec.

We recommend a parking stand into which either the front wheel or rear wheel can be inserted securely for pedelecs which do not have a kickstand.

6.6.8 Additional battery headlight

Fitting additional battery headlights is permitted provided they comply with the laws of the country where the pedelec will be ridden and if they are approved for use on e-bikes.

6.6.9 Mobile holder

A holder for SP Connect mobile case is fitted to the stem.

- ✓ Observe the operating instructions for the mobile and the SP Connect mobile case.
- ✓ Use on tarmacked roads only.
- ✓ Protect mobile from theft.
- ► To attach: insert the SP Connect mobile case in the holder and turn 90° to the right.
- ► To release: turn the SP Connect mobile case 90° to the left and remove.

6.6.10 Suspension fork coil spring

If the desired suspension fork sag cannot be achieved after adjustment, the coil spring assembly must be replaced with a softer or harder spring.

- Fit a softer coil spring assembly group to increase the sag.
- Fit a harder coil spring assembly group to decrease the sag.
- 6.6.11 Fixed weather protection systems

Fixed weather protection systems are only permitted with the vehicle manufacturer's approval.

6.7 Personal protective equipment and accessories for road safety

Seeing and being seen is crucial in road traffic. The following requirements must be met for riding a pedelec safely on public roads.

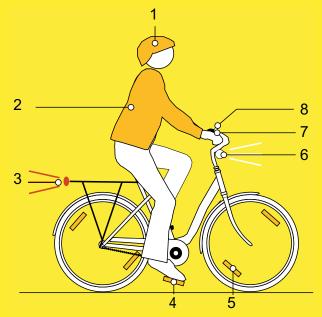

Figure 112: Road safety

- 1 The helmet must have a reflective strip or a light in a clearly visible colour.
- 2 Cycle clothing is essential at all times of year. Clothing should be retroreflective or as light as possible. Fluorescent materials are also suitable. High-visibility jackets and straps on your upper body ensure even greater safety. Never wear a skirt. Always wear trousers which reach down to your ankles instead.
- 3 The large red reflector with a "Z" registration mark and the red rear light must be clean. The rear light is attached high enough so that cars can see it (minimum height 25 cm). The rear light must work.
- 4 The two reflectors on the two non-slip pedals must be clean.
- 5 The yellow spoke reflectors on both wheel or the white, fluorescent surface on both wheels must be clean.
- 6 The white front light must work and must be positioned so that it does not dazzle other road users. The white front light and the white reflector must be clean at all times.

- 7 The **two separate brakes** on the pedelec must work at all times.
- 8 The clear sounding bell must be fitted and must work.

6.8 Before each ride

Check pedelec before each ride; see Section 7.1.

Check list before each ride

Check everything is sufficiently clean.	See Section <u>7.2</u>
Check guards.	See Section 7.1.1
Check battery to ensure it is firmly in place.	See Section 6.16.2
Check lights.	See Section 7.1.13
Check brake.	See Section 7.1.14
Check suspension seat post.	See Section 7.1.9
Check pannier rack.	See Section 7.1.5
Check bell.	See Section 7.1.10
Check handles.	See Section 7.1.11
Check rear frame damper.	See Section 7.1.4
Check frame.	See Section 7.1.2
Check wheel concentricity.	See Section 7.1.7
Check quick releases.	See Section 7.1.8
Check mudguards.	See Section 7.1.6
Check USB cover.	See Section 7.1.12

- Be alert to any unusual noises, vibrations or odours while riding. Be alert to any unusual operating sensations when braking, pedalling or steering. This indicates material fatigue.
- Take pedelec out of service if there are any deviations from the "Before each ride" checklist or any unusual behaviour. Contact specialist dealer.

6.9 Straightening the quickly adjustable stem

Only applies to pedelecs with this equipment

1 Open stem clamping lever.

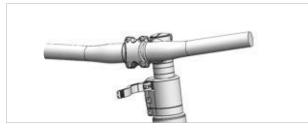

Figure 113: Example of All Up with open stem clamping lever

2 Pull handlebars into the highest possible position.

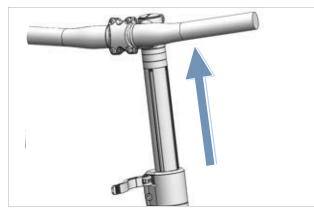

Figure 114: Example of All Up pulled into highest possible position

3 Turn handlebars 90° anti-clockwise so that they are straight.

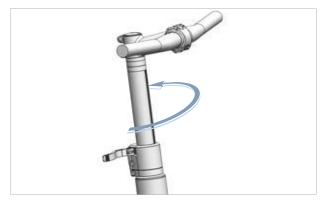

Figure 115: Example of All Up in straight position

- 4 Place handlebars at required height.
- 5 Close stem clamping lever.

6.10 Using the pannier rack

Crash caused by loaded pannier rack

The pedelec is handled differently with a loaded *pannier rack*, in particular when the rider needs to steer and brake. This can lead to a loss of control. This may cause a crash with injuries.

► You should practice how to use a loaded pannier rack safely before using the pedelec in public spaces.

Crushing the fingers in the spring flap

The spring flap on the *pannier rack* operates with a high clamping force. There is a risk of crushing the fingers.

- Never allow the spring flap to snap shut in an uncontrolled manner.
- Be careful where you position your fingers when closing the spring flap.

Crash caused by unsecured baggage

Loose or unsecured objects on the *pannier rack*, e.g. belts, may become caught in the rear wheel. This may cause a crash with injuries. Objects which are fastened to the pannier rack may cover the *reflectors* and the *riding light*. Other users may not see the pedelec on public roads as a result. This may cause a crash with injuries.

- Secure any objects which are attached to the pannier rack sufficiently.
- Objects fastened to the pannier rack must never cover the reflectors, the headlight or the rear light.
- Distribute the baggage as evenly as possible between the left- and right-hand side.
- We recommend the use of panniers and baggage baskets.

Figure 116: The maximum load bearing capacity is indicated on the pannier rack

- Pack the pedelec to its maximum permitted total weight (PTW) only.
- Pack the pedelec to the pannier rack's maximum load capacity only.
- ▶ Use the original pannier rack only.

6.11 Raising the kickstand

 Use your foot to raise kickstand completely before setting off.

6.12 Using the saddle

- Do not wear studded jeans as these can damage the saddle covering.
- ► Wear dark clothes for your first few rides as new leather saddles can stain clothing.

Riders often experience pain in the sitting bones, especially beginners or at the start of the season, after a longer break. The periosteum around the sitting bones is irritated as it is unaccustomed to the chafing. To reduce chafing:

- Wear cycling shorts with shock-absorbing seat padding.
- ▶ Use a chamois cream or ointment.
- ⇒ The sensation of pain is reduced after five to six rides, although it may increase again after two to three weeks of riding.

6.12.1 Using the leather saddle

Sunlight and UV light tarnish the colour and cause the leather to dry out and fade.

- Park pedelec in the shade.
- Always use a saddle cover.

Moisture may cause the leather to detach from material beneath and mould may form.

- If the leather saddle gets wet, dry saddle completely.
- Always use a saddle cover.

6.13 Using the pedals

► The ball of the foot is placed on the pedal when riding and pedalling.

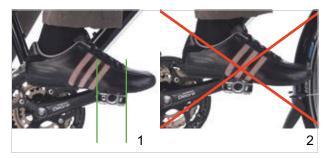

Figure 117: Correct (1) and incorrect (2) foot position on the pedal

6.14 Using the bell

- 1 Press the bell button downwards.
- 2 Let button spring back.

6.15 Using the handlebars

- ▶ Wear heavily padded cycling gloves.
- ➡ This helps protect sensitive areas of your palms.
- Vary your grip position continuously while riding.
- ⇒ This prevents overstraining and fatigue in your hands.

6.15.1 Using multi-position handlebars

Only applies to pedelecs with this equipment

Multi-position handlebars are ideal for dynamic riding. The contoured ends of the handlebars, also known as horn handlebars, provide a variety of grip options. Changing muscle groups reduces strain on the hands, arms and back during longer rides.

- Vary your grip position continuously while riding.
- ⇒ This prevents overstraining and fatigue in your hands.

Figure 118: Grip positions on the multi-position handlebars

Grip position 1

The top grip position is suitable for riding slowly.

 Straighten your upper body without tensioning in this position.

Grip position 2 and 3

The middle and bottom grip position is suitable for fast rides and riding on inclines.

- In the middle position, hold the arm and wrist upright and relax tension.
- In the bottom position, place your upper body slightly lower. Keep your fingers close to the brake handle ready for use.

6.15.2 Using bar ends

Only applies to pedelecs with this equipment

Bar ends can be added to normal handlebars.

Adjustable bar ends feature a ball joint which you can use to choose the optimum position as required.

- Adjust bar ends correctly. To do so, your hand, elbow and shoulder must be in line with one another when the hand takes hold of the bar ends
- During the ride, keep varying your grip position between a flat (1) and upright (2) hand position
- ➡ This prevents overstraining, fatigue and numbness in your hands and fingers.

Figure 119: Grip positions on a bar end

6.15.3 Using leather handles

Only applies to pedelecs with this equipment

Sweat and grease from the skin are two of the greatest enemies of leather. They penetrate the surface of leather and cause it to disintegrate more quickly, meaning the leather can soften and abrade.

▶ Wear gloves.

Sunlight and UV light damage the colour and can cause the leather to dry out and fade.

Park pedelec in the shade.

Moisture may cause the leather to detach from material beneath and mould may form.

If the leather handles get wet, dry handles completely.

6.16 Use suspension and damping

6.16.1 Locking the suspension

A suspension system is designed to cushion and compensate for unevenness on a surface whether the user is riding on bumpy cycle paths, dirt roads or off road.

A suspension system absorbs great deal of motor and muscle power during rides uphill or on optimally tarmacked roads. This increases energy consumption and reduces propulsion. It thus makes sense to lock the suspension on tarmacked roads and when riding uphill. Some suspension forks thus feature a lockout on the fork crown or a remote lockout on the handlebars.

	Mode	Use
1	OPEN	Setting off
2	Middle position	Bumpy roads
3	LOCK	Uphill or tarmacked roads

6.16.1.1 Locking the SR SUNTOUR suspension fork

Table 44: Lockout on the fork crown on SR Suntour suspension forks

- Turn lockout (1) on the fork crown clockwise to LOCK.
- Turn lockout (1) on the fork crown anticlockwise to OPEN.

⇒ The suspension fork is blocked.

⇒ The suspension fork is open.

Table 45: SR Suntour suspension fork lockout on the handlebars

- ▶ Press locking lever (1) on the handlebars.
- ⇒ The suspension fork is blocked.

- ▶ Press **release lever** (2) on the handlebars.
- \Rightarrow The suspension fork is open.

6.17 Using the battery

✓ Switch off the battery and the drive system before removing or inserting the battery.

6.17.1 Removing the battery

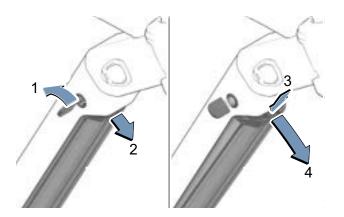

Figure 120: Removing the integrated battery

- **1** Open battery lock with battery key (1).
- ⇒ The battery is released and falls into the retainer guard (2).
- **2** Hold the battery in your hand from below. Use the other hand to push on the retainer guard from above (3).
- ⇒ The battery is released and falls into the hand (4).
- **3** Remove the battery from the frame.
- 4 Remove the battery key from the battery lock.

6.17.1.1 Inserting the battery

- ✓ The key is inserted in the lock.
- ✓ The lock is unlocked.

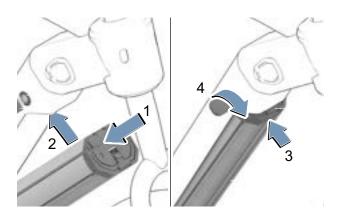

Figure 121: Inserting the integrated battery

- **1** Place the battery into the lower mount with the contacts facing the front (1).
- **2** Flip the battery upwards so that the battery is held by the retainer guard (2).
- 3 Keep the lock open with the key.
- 4 Push the battery upwards (3).
- ⇒ The battery can be heard locking into place.
- **5** Check battery to ensure it is firmly in place on all sides.
- 6 Lock the battery with the battery key; otherwise, the battery may fall out of the mount when you open the see (4).
- 7 Remove the battery key from the battery lock.
- 8 Check the battery to ensure it is firmly in place before each ride.

6.17.2 Charging the battery

The battery can remain on the pedelec or can be removed for charging. Interrupting the charging process does not damage the battery. The battery is fitted with a temperature monitoring system which only allows charging within a temperature range between 0 $^{\circ}$ C and 40 $^{\circ}$ C.

- ✓ The ambient temperature during the charging process lies within the range between 0 °C to 40 °C.
- 1 Remove the cable connection cover if necessary.
- **2** Connect the mains plug of the charger to a normal domestic, grounded socket.

Connection data

230 V, 50 Hz

Notice

- Check that mains voltage! The power source voltage must match the voltage indicated on the charger nameplate. Chargers labelled 230 V may be operated at 220 V.
- **3** Connect the charging cable to the battery's charging port.
- ⇒ The charging process starts automatically.
- ⇒ The battery level indicator shows the charge level during charging. When the drive system is switched on, the *on-board computer* displays the charging process.

Notice

If an error occurs during the charging process, a system message is displayed.

- Remove the charger and battery from operation immediately and follow the instructions.
- ➡ The charging process is complete when the LEDs on the battery level indicator go out.

- 4 Once charging is complete, disconnect the battery from the charger.
- **5** Disconnect the charger from the mains.

6.18 Using the electric drive system

6.18.1 Switching on the electric drive system

Crash caused by lack of readiness for braking

When it is switched on, the drive system can be activated by applying force to the pedals. There is a risk of a crash if the drive is activated unintentionally and the brake is not reached.

- Never start the electric drive system, or switch it off immediately, if the brake cannot be reached safely and reliably.
- ✓ A sufficiently charged battery has been inserted into the pedelec.
- ✓ The battery is firmly positioned and locked. The battery key has been removed.
- ✓ The speed sensor is connected correctly.

There are two options for switching on the drive system.

On-Off button (on-board computer)

Press the On-Off button (on-board computer) briefly (< 3 seconds).</p>

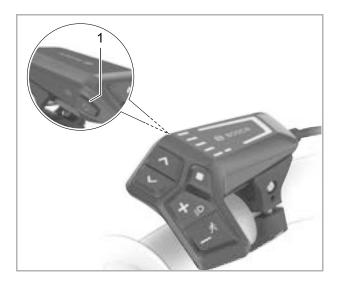

Figure 122: Position of the On-Off button on the BOSCH LED Remote

On-Off button (battery)

- Press the On-Off button (battery) briefly.
- All LEDs on the on-board computer will light up briefly.
- ➡ The battery level is displayed in colour by the battery level indicator (on-board computer) and the configured level of assistance by the indicator for the selected level of assistance. The pedelec is ready to ride.
- ⇒ If the battery capacity is less than 5%, the battery level indicator will remain dark. Only the on-board computer indicates whether the drive system is switched on or not.

If the drive system is switched on, the drive is activated as soon as the pedals are moved with sufficient force (except if the selected level of assistance is "OFF"). The motor power is based on the level of assistance selected on the onboard computer.

6.18.2 Switching off the electric drive system

As soon as the rider stops pushing the pedals in normal mode or reaches a speed of 25 km/h, the drive system switches off the assistance system. The assistance system starts up again when you push the pedals and your speed is less than 25 km/h.

The system switches off automatically ten minutes after the last command.

There are two options for switching off the drive system manually.

On-Off button (on-board computer)

Press the On-Off button (on-board computer) briefly (< 3 seconds).</p>

On-Off button (battery)

- Press the On-Off button (battery).
- ⇒ The battery level indicator (on-board computer) and the indicator for the selected level of assistance go out.
- ⇒ The pedelec is switched off.

6.19 Using the on-board computer

Notice

Never use on-board computer, the display or the display mount as a handle. If the on-board computer, display or display mount are used to lift the pedelec, components can become irreparably damaged.

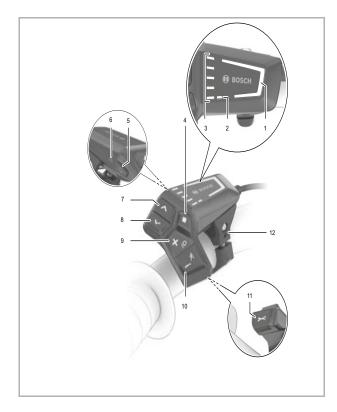

Figure 123: Overview of BOSCH LED Remote control panel

	Symbol	Designation
1		Selected level of assistance indicator
2		ABS indicator (optional)
3		Battery level indicator (control panel)
4	•	Select button
5	Q	On-Off button (control panel)
6		Ambient light sensor

Table 46: Overview of control panel

	Symbol	Designation
7	>	Increase brightness button/ forward button
8	<	Decrease brightness button/ back button
9	+	Plus button/ light button
10	-	Minus button/ push assist button
11		Diagnosis connection (for maintenance pur- poses only)
12		Mount

Table 46: Overview of control panel

6.19.1 Using the diagnosis port

Notice

A USB connection is not a waterproof plug connection. Any moisture penetrating through the USB port may trigger a short circuit in the control panel.

- Never connect an external device.
- Regularly check the position of the rubber cover on the USB port and adjust it as necessary.

The diagnosis connection is only designed for maintenance purposes and is not suitable for connecting external devices.

Keep the diagnosis port flap closed at all times to ensure no dust or moisture can penetrate through the port.

6.19.2 Charging the control panel battery

If both the charge level in the battery and the control panel's internal battery are low, the battery can be charged via the diagnosis port.

Connect the internal battery to a power bank or another suitable power source with a USB type C® cable. (charge voltage: 5 V; charging current: max. 600 mA).

6.19.3 Using the riding light

✓ The drive system needs to be already switched on to turn on the *riding light*.

Figure 124: Position of riding light button (1)

- ▶ Press the light button for more than 1 second .
- ➡ The front light and rear light are both switched on (*riding light symbol* is displayed) and switched off (*Riding light symbol* is switched off) at the same time.

6.19.4 Setting the brightness of indicators

The ambient light sensor regulates the indicator brightness.

 The ambient light sensor must be clean and must not be covered.

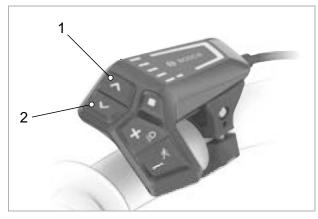

Figure 125: Position of increase brightness button (2) and decrease brightness button (1)

Press the increase brightness button and decrease brightness button to set the brightness of the indicator LEDs.

6.19.5 Using the push assist system

Injury from pedals or wheels

The pedals and the drive wheel turn when the push assist system is used. There is a risk of injury if the pedelec wheels are not in contact with the ground when the push assist system is used (e.g. when carrying the pedelec up stairs or when placing it on a bicycle rack).

- Only use the push assist mode when pushing the pedelec.
- ► You must steer the pedelec securely with both hands when using push assist.
- Allow for enough freedom of movement for the pedals.

The push assist helps move the pedelec. The push assist system speed depends on the selected gear. The lower the selected gear is, the lower the speed in the push assist function is (at full power). The maximum speed is 6 km/h.

✓ We recommend using first gear for cycling uphill to protect the drive.

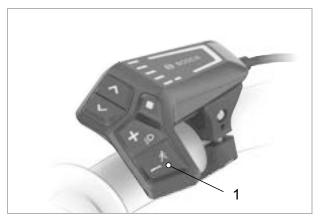

Figure 126: Position of push assist button (1)

- 1 Press **Push assist button** for longer than 1 seconds. Hold down the button.
- ⇒ The battery level indicator goes out and a white running light in the direction of travel indicates push assist is ready.
- **2** One of the following actions must be taken within the next 10 seconds:
- Push pedelec forwards.
- Push pedelec backwards.
- ▶ Make a weaving movement with the pedelec.
- ➡ The push assist is activated. The continuous white bars change colour to ice blue.
- ⇒ The motor starts to push.
- **3** Release **push assist button** on the control panel to switch off push assist.
- 4 Push the **push assist button within 10** seconds to reactivate motor assistance.
- 5 If motor assistance deactivates within 10 seconds, the push assist function switches off automatically.

Push assist will also switch off automatically if

- the rear wheel blocks
- speed bumps cannot be ridden over
- a part of the body is blocking the bicycle crank
- an obstacle turns the crank further
- · the rider pedals
- the plus button or On-Off button is pressed.

The push assist mode of operation is subject to country-specific regulations and may therefore differ from the above description or may be deactivated.

6.19.6 Selecting the level of assistance

The control panel is used to set how much the electric drive should assist the rider when pedalling. You can change the level of assistance at any time while you are cycling.

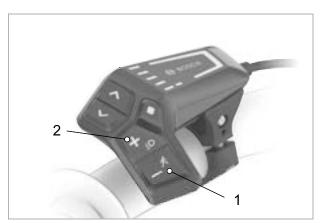

Figure 127: Position of plus and minus buttons

- Press the plus button (2) on the control panel to increase the level of assistance.
- Press the minus button (1) on the control panel to reduce the level of assistance.
- ⇒ The motor power used is displayed in colour in the level of assistance indicator.

If the system is switched off, the level of assistance last displayed is saved.

6.20 Using the brake

6.20.1 Use handbrake

Only applies to pedelecs with this equipment

WARNING

Crash caused by brake failure

Oil or lubricant on the brake disc in a disc brake or on the rim of a rim brake can cause the brake to fail completely. This may cause a crash with serious injuries.

- Never allow oil or lubricant to come into contact with the brake disc or brake linings or on the rim of a rim brake.
- If the brake linings have come into contact with oil or lubricant, contact specialist dealer to have the components cleaned or replaced.

If the brakes are applied continuously for a long time (e.g. while riding downhill for a long time), the fluid in the brake system may heat up. This may create a vapour bubble. This will cause air bubbles or water contained in the brake system to expand. This may suddenly make the lever travel wider. This may cause a crash with serious injuries.

- Release the brake regularly when riding downhill for a longer period of time.
- Use the front and rear wheel brakes alternately.

The motor's drive force is switched off during the ride as soon as the pedelec rider is no longer pedalling. The electric drive system does not switch off when braking.

In order to achieve optimum braking results, do not pedal while braking.

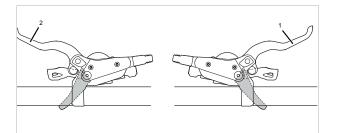

Figure 128: Handbrake, front (2) and rear (1) – Shimano brake used as an example

- Pull the left handbrake to apply the front wheel brake.
- Pull the right handbrake to apply the rear wheel brake.

6.20.2 Using the back-pedal brake

Only applies to pedelecs with this equipment

- **1** Move pedals a little beyond the 3 o'clock and 9 o'clock position.
- 2 Pedal in the opposite direction to the *direction of travel* until the desired speed has been reached.

6.21 Gear shift

The selection of the appropriate gear is a prerequisite for a physically comfortable ride and making sure that the electric drive system functions properly. The ideal pedalling frequency is between 70 and 80 revolutions per minute.

Stop pedalling briefly when changing gears. This makes it easier to switch gears and reduces wear on the drivetrain.

6.21.1 Switching the SHIMANO Rapidfire derailleur gears

The speed and range can be increased while applying the same force if you select the right gear.

✓ Stop pedalling briefly when changing gears. This makes it easier to switch gears and reduces wear on the drivetrain. However, keep the crank moving while switching gears.

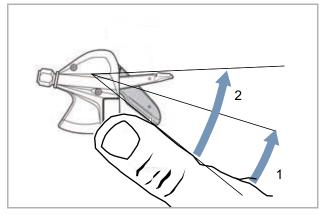

Figure 129: Switching gears with lever A, using gear shift SL-M315 as an example

Lever A switches from a smaller sprocket to a larger one. The number of pinions switched depends on the selected position of lever A.

- ▶ Place shifter A in position 1.
- ⇒ System shifts one sprocket higher.
- ▶ Place shifter A in position 2.
- ⇒ System shifts two pinions higher.

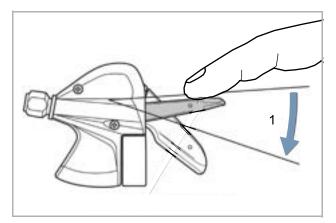

Figure 130: Switching gears with lever B, using gear shift SL-M315 as an example

Lever B switches from a larger sprocket to a smaller one.

- ▶ Place shifter B in position 1.
- ⇒ System shifts one sprocket lower.

Switching gears

- Select the appropriate gear with the gear shift unit.
- ⇒ The gear shift switches gear.
- ⇒ The shifter returns to its original position.
- Clean and lubricate the rear derailleur if gear changes block.

6.22 Parking the pedelec

Notice

Heat or direct sunlight can cause the *tyre pressure* to increase above the permitted maximum pressure. This can destroy the *tyres*.

- ▶ Never park the pedelec in the sun.
- On hot days, regularly check the tyre pressure and adjust it as necessary.

Moisture penetrating at low temperatures may impair individual functions due to the open structural design.

- Always keep the pedelec dry and free from frost.
- If the pedelec is to be used at temperatures below 3 °C, the specialist dealer must carry out an inspection and prepare it for winter use.

The pedelec's force of weight may cause the kickstand to sink into soft ground, possibly causing the pedelec to topple over as a result.

- ▶ Park the pedelec on firm, level ground only.
- 1 Switch off the drive system (see Section 6.18).
- 2 After getting off, use your foot to lower the kickstand completely before parking. Ensure that it is stable.
- **3** Park the pedelec carefully and check that it is stable.
- 4 Clean the suspension fork and pedals (see Section <u>7.4</u>.)
- **5** Protect the saddle with a saddle cover if you park the pedelec outside.
- 6 Secure the pedelec with a bicycle lock.
- 7 Remove the battery and, if applicable, your mobile to ensure protection against theft.
- 8 Clean and service pedelec after every ride; see Section <u>7.2</u>.

Checklist after each ride

Cleaning		
	Lights and reflectors	See Section 7.2.5
	Brake	See Section 7.2.5
	Suspension fork	See Section 7.2.1
	Suspension seat post	See Section 7.2.6
	Rear frame damper	See Section 7.2.7
	Pedal	See Section 7.2.4
Care		
	Suspension fork	See Section <u>3</u>

6.22.1 Screwing in the quickly adjustable stem

Only applies to pedelecs with this equipment

Screw in the quickly adjustable stem to save space when parking

1 Open stem clamping lever.

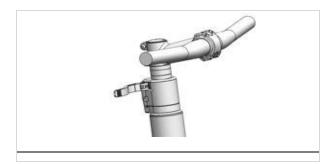

Figure 131: Example of All Up with open stem clamping lever

2 Pull handlebars into highest possible position.

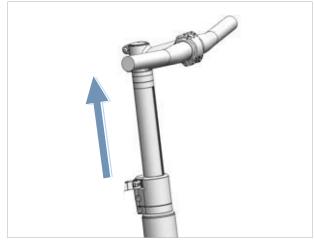

Figure 132: Example of All Up pulled into highest possible position

3 Turn handlebars 90° in a clockwise direction.

Figure 133: Example of All Up screwed in

- 4 Place handlebars at required height.
- 5 Close stem clamping lever.

6.22.2 Activating the lock function

Only applies to pedelecs with this equipment

- Remove the on-board computer used during set-up.
- ⇒ The lock function is activated. The drive system now provides no assistance However, the rider can continue to use the pedelec without assistance.
- ⇒ The drive unit will emit a lock sound (an audible signal) as long as the drive system is switched on.
- The lock function status is displayed with a lock icon on the on-board computer for around 3 seconds.

7 Cleaning, servicing and inspection

Clean, maintain and inspect pedelec as indicated on checklists.
 Complying with these cleaning instructions can increase operational reliability, reduce wear on components, extend the service life of components and ensure safety.

Checklist: Before each ride		
	Check everything is sufficiently clean	See Section 7.2
	Check guards	See Section 7.1.1
	Check battery to ensure it is firmly in place	See Section 6.17.2
	Check lights	See Section 7.1.13
	Check brake	See Section 7.1.14
	Check suspension seat post	See Section 7.1.9
	Check pannier rack	See Section 7.1.5
	Check bell	See Section 7.1.10
	Check handles	See Section 7.1.11
	Check rear frame damper	See Section 7.1.4
	Check wheel concentricity	See Section 7.1.7
	Check frame	See Section 7.1.2
	Check quick releases	See Section 7.1.8
	Check guards	See Section 7.1.6
	Check USB cover	See Section 7.1.12
Checklist: After each ride		
	Clean lights	See Section 7.2.1
	Clean reflectors	See Section 7.2.1
	Clean brake	See Section 7.2.5
	Clean suspension fork	See Section 7.2.2
	Maintain suspension fork	See Section 3
	Clean suspension seat post	See Section 7.2.6
	Clean rear frame damper	See Section 7.2.7

See Section 7.2.4

Checklist: weekly tasks		
_	Clean chain	See Section 7.3.18
	City, folding, cargo and children's bikes and bicycles for young adults	When dry: every 10 days In wet conditions: every 2–6 days
	Trekking and racing bikes	When dry: every 140… 200 km In wet conditions: every 100 km
	Mountain bikes	When dry: every 60 100 km In wet conditions: after every ride
	Belt (every 250–300 km)	See Section 7.3.17
0	Servicing the chain	See Section 7.4.16 and 7.4.16.1
	City, folding, cargo and children's bikes and bicycles for young adults	When dry: every 10 days In wet conditions: every 2 6 days
	Trekking and racing bikes	When dry: every 140… 200 km In wet conditions: every 100 km
	Mountain bikes	When dry: every 60… 100 km In wet conditions: maintain all the time
	Maintain all-round chain guard.	See Section 7.4.16.1
	Check tyre pressure (at least once a week)	See Section 7.5.1.1
	Check tyres (every 10 days)	See Section 7.5.1.2
	Eightpins seat post Refill oil (every 20 hours)	See Section 7.4.19

Clean the pedals

Checklist: monthly tasks		
	Cleaning the battery	See Section 7.3.2
	Clean on-board computer	See Section 7.3.1
	Clean on-board computer	See Section 7.3.1
	Check disc brake linings (once a month or after braking 1,000 times)	See Section 7.5.2.4
	Check rim brake brake linings (once a month or after braking 3000 times)	See Section 7.5.1.3
	Checking the rim braking surface for wear	See Section 7.5.2.6
	Clean handbrake	See Section 7.3.15.1
	Clean brake disc	See Section 7.3.16
	Check brake disc	See Section 7.5.2.4
	Check brake Bowden cables	See Section 7.5.2.3
	Clean pannier rack	See Section 7.3.4
	Clean handles	See Section 7.3.7
	Maintain handles	See Section 7.4.8
	Check handbrake	See Section 7.5.2.1
	Check hydraulic system	See Section 7.5.2.2
	Clean cassette	See Section 7.3.14
	Clean chain and all-round chain guard	See Section 7.3.18.1
	Clean chain wheels	See Section 7.3.14
	Clean leather handles	See Section 7.3.7.1
	Maintain leather handles	See Section 7.4.8.2
	Clean the leather saddle	See Section 7.3.9.1
	Maintain leather saddle	See Section 7.4.11
	Clean handlebars	See Section 7.3.6

Checklist: monthly tasks		
	Cleaning the motor	See Section 7.3.3
	Clean hub	See Section 7.3.12
	Cleaning the frame	See Section 7.3.4
	Clean tyres	See Section 7.3.10
	Check back-pedal brake	See Section 7.5.2.5
	Clean saddle	See Section 7.3.9
	Clean seat post	See Section 7.3.8
	Maintain seat post	See Section 7.4.9
	Clean shifter	See Section 7.3.13.1
	Cleaning gear shift	See Section 7.3.13
	Clean shift cables	See Section 7.3.13
	Check disc brake	See Section 7.5.2.4
	Clean mudguard	See Section 7.3.4
	Clean kickstand	See Section 7.3.4
	Clean spokes and spoke nipples	See Section 7.3.11
	Maintain spoke nipples	See Section 7.4.13
	Clean rigid fork	See Section 7.3.4
	Clean transmission	See Section 7.3.13
	Clean front derailleur	See Section 7.3.14
	Clean stem	See Section 7.3.5

Checklist: Quarterly tasks		
	Check brake pressure point	See Section 7.5.2.1
	Check rim brake (100 hours trip time or every 2,000 km)	See Section 7.5.2.6
	Checking the spokes	See Section 7.5.1.3

Checklist: Tasks performed at least every six months (or every 1,000 km)		
	Check Bowden cables gear shift	See Section 7.5.16.2
	Maintain handbrake	See Section 7.4.18.1
	Maintain carbon seat post	See Section 7.4.9.2
	Check gear shift electric cables	See Section 7.5.16.1
	Maintain suspension seat post	See Section 7.4.9.1
	Maintain rims	See Section 7.4.10
	Check rims	See Section 7.5.1.3
	Check rim hooks	See Section 7.5.1.3
	Maintain fork	See Section 7.4.2
	Check gear shift	See Section 7.5.16
	Maintain pannier rack	See Section 7.4.3
	Check chain	See Section 7.5.15.1
	Check derailleur gears	See Section 7.5.15.1 and 7.5.16.3
	Check chain tension	See Section 7.5.4.1 and 7.5.4.2
	Check wheel	See Section 7.5.1
	Maintain handlebars	See Section 7.4.7
	Check handlebars	See Section 7.5.12
	Check light	See Section 7.5.10
	Maintain hub	See Section 7.4.12
	Check hub	See Section 7.5.15.2
	Check nipple holes	See Section 7.5.1.4
	Maintain pedals	See Section 7.4.15
	Check pedal.	See Section 7.5.14
	Maintain frame	See Section 7.4.1
	Check belt tension	See Section 7.5.9
	Check saddle	See Section 7.5.13
	Maintain shifter	See Section 7.4.14.2
	Maintain rear derailleur articulated shaft	See Section 7.4.14.1
	Maintain rear derailleur jockey wheels	See Section 7.4.14.1
	Maintain kickstand	See Section 7.4.5
	Check kickstand stability	See Section 7.5.20

Checklist: Tasks performed at least every six months (or every 1,000 km)			
	Check steering headset	See Section 8.5.6	
	Servicing the stem	See Section 7.4.6	
	Checking the stem	See Section 7.5.11	
Checklist: Annual tasks (or every 2000 km)			

Adjust hub with cone bearing	See Section 8.5.6
Check nipple well (every 1,000 hours or every 2,000 km)	See Section 7.5.1.5

Crash caused by brake failure

Oil or lubricant on the brake disc in a disc brake or on the rim of a rim brake can cause the brake to fail completely. This may cause a crash with serious injuries.

- Never allow oil or lubricant to come into contact with the brake disc or brake linings or on the rim of a rim brake.
- If the brake linings have come into contact with oil or lubricant, contact specialist dealer to have the components cleaned or replaced.
- After cleaning, servicing or repair, carry out a few test brake applications.

The brake system is not designed for use on a pedelec which is placed on its side or turned upside down. The brake may not function correctly as a result. This can cause a crash, which may result in injuries.

If pedelec has been placed on its side or turned upside down, apply the brakes a couple of times before setting off to ensure they work as normal.

The brake seals are unable to withstand high pressures. Damaged brakes can fail and cause an accident with injury.

Never clean the pedelec with a pressure washer or compressed air.

Take great care when using a hosepipe. Never point the water jet directly at the seal section.

Crash and falling caused by unintentional activation

There is a risk of injury if the electric drive system is activated unintentionally.

Remove the battery before cleaning.

Notice

Water may enter the inside of the bearings if you use a steam jet. This dilutes the lubricant inside, the friction increases and, as a result, the bearings are permanently damaged in the long term. Water may also penetrate the electric components and damage them permanently.

Never clean pedelec with a pressure washer, water jet or compressed air.

Greased parts, such as the seat post, the handlebars or the stem, may no longer be safely and reliably clamped.

Never apply grease or oil to parts which are clamped.

Harsh cleaning agents such as acetone, methylene and trichloroethylene and solvents such as thinners, alcohol and corrosion protection can attack pedelec components and damage them permanently.

 Use approved care and cleaning products only.

7.1 Before each ride

Complying with these cleaning instructions is the only way to reduce wear on components, increase the operating hours and guarantee safety.

7.1.1 Checking the guards

The chain or belt guards, mudguards or the motor cover may break and fall off when the pedelec is transported or parked outside.

- Check that all guards are in place.
- Take pedelec out of service if a guard is damaged or missing. Contact specialist dealer.

7.1.2 Checking the frame

- Check frame for cracks, warping and damage to the paintwork.
- If there are any cracks, warping or damage to the paintwork, remove the pedelec from service. Contact specialist dealer.

7.1.3 Checking the fork

- Check fork for cracks, warping, tarnished components, leaked oil and damage to the paintwork. Also look at hidden parts on the underside.
- ➡ If there are any cracks, warping, tarnished components, leaked oil or damage to the paintwork, remove the pedelec from service. Contact specialist dealer.

7.1.4 Checking the rear frame damper

- Check rear frame damper for cracks, warping, tarnished components, leaked oil and damage to the paintwork. Also look at hidden parts on the underside.
- ➡ If there are any cracks, warping, tarnished components, leaked oil or damage to the paintwork, remove the pedelec from service. Contact specialist dealer.

7.1.5 Checking the pannier rack

- **1** Hold onto pedelec by its frame. Hold onto pannier rack with the other hand.
- **2** Move the pannier rack backwards and forwards to check that all screw connections are firmly in place.
- ⇒ Tighten loose screws.
- Attach loose baskets permanently with a basket bracket or cable ties.

7.1.6 Checking the mudguards

- 1 Hold onto pedelec by its frame. Hold onto mudguard rack with the other hand.
- **2** Move the mudguard backwards and forwards to check that all screw connections are firmly in place.
- ⇒ Tighten loose screws.

7.1.7 Check wheel concentricity

- Lift the front and rear wheels one after the other and spin each wheel when lifted.
- ⇒ If the wheel is loose or crooked when it turns, take pedelec out of service. Contact specialist dealer.

7.1.8 Checking the quick releases

- Check quick releases to ensure that all quick releases are firmly in their fully closed end position.
- ➡ If a quick release is not firmly in its closed end position, open quick release and place in its end position.
- ➡ If the quick release cannot be firmly placed in its end position, take pedelec out of service. Contact specialist dealer.

7.1.9 Checking the suspension seat post

- Deflect and let the suspension seat post rebound.
- ➡ If you hear unusual noises when the suspension seat post deflects and rebounds, or it yields without any resistance, take pedelec out of service. Contact specialist dealer.

7.1.10 Checking the bell

- 1 Press the bell button downwards.
- 2 Let button spring back.
- ➡ If you do not hear a clear, distinct ring of the bell, replace bell. Contact specialist dealer.

7.1.11 Checking the handles

- Check the handles are firmly in place.
- ⇒ Screw loose handles firmly into place.

7.1.12 Checking the USB cover

➡ If featured, check the position of the *cover on the USB port* on a regular basis and adjust if necessary.

7.1.13 Checking the riding light

- **1** Switch light on.
- 2 Check that the headlight and rear light come on.
- ⇒ If the headlight and rear lights do not come on, take pedelec out of service. Contact specialist dealer.

7.1.14 Checking the brake

- **1** Pull both handbrakes when stationary.
- 2 Push the pedals.
- ➡ If no resistance is generated in the handbrake's usual position, take pedelec out of service. Contact specialist dealer.
- ➡ If the brake is losing fluid, take pedelec out of service. Contact specialist dealer.

7.2 After each ride

Complying with these cleaning instructions is the only way to reduce wear on components, increase the operating hours and guarantee safety.

The following items should be ready for use to clean the pedelec after each ride:

ΤοοΙ		Cleaning agent	
Cloth	Bucket	≫ Water	Dish-washing liquid
Brush	Fork oil	Silicone or Teflon oil	Acid-free lubricating grease

7.2.1 Cleaning the riding light and reflectors

- 1 Clean headlight, rear light and reflectors with a damp cloth.

7.2.2 Cleaning the suspension fork

- 1 Remove dirt and deposits from the stanchions and deflector seals with a damp cloth. Check stanchions for dents, scratches, staining or leaking oil.
- 2 Lubricate the dust seals and stanchions with a few drops of silicone spray.
- 3 Maintain the suspension fork after cleaning.
- 7.2.3 Maintaining the suspension fork

► Treat dust seals with fork oil.

7.2.4 Cleaning the pedals

• Clean pedals with a brush and soapy water.

7.2.5 Cleaning the brake

- Clean dirt on the rim and brake components with a slightly dampened cloth.
- 7.2.6 Cleaning the suspension seat post

 Clean dirt on the articulated joints with a slightly dampened cloth immediately after a ride.

7.2.7 Cleaning the rear frame damper

 Clean dirt on the articulated joints with a slightly dampened cloth immediately after a ride.

7.3 Basic cleaning

Complying with these basic cleaning instructions is the only way to reduce wear on components, increase the operating hours and guarantee safety.

ΤοοΙ		Cleanir	ng agent
Gloves	Toothbrush	e water	Lubricant
Cloth	Paintbrush	Dish-washing liquid	Brake cleaner
Sponge	Watering can	Degreaser	Leather cleaner
Brushes	Bucket		

 Table 48: Required tools and cleaning agents for basic cleaning

 Remove battery and on-board computer before thorough cleaning.

7.3.1 Clean on-board computer and control panel

Notice

If water enters the on-board computer, it will be permanently damaged.

- Never immerse the on-board computer in water.
- ▶ Never use a cleaning agent.
- Carefully clean the on-board computer and control panel with a soft, damp cloth.

7.3.2 Cleaning the battery

Risk of fire and explosion due to penetration by water

The battery is only protected from simple spray water. Penetration by water can cause a short circuit. The battery may self-ignite and explode.

- ► Keep contacts dry and clean.
- ► Never immerse the battery in water.

Notice

- ▶ Never use a cleaning agent.
- 1 Clean the battery electrical connections with a dry cloth or paintbrush only.
- **2** Wipe off the decorative sides with a damp cloth.
- 7.3.3 Cleaning the motor

Notice

If water enters the motor, it will be permanently damaged.

- ▶ Never open the motor.
- ▶ Never immerse the motor in water.
- Never use cleaning agents.
- Carefully clean the motor on the outside with a soft, damp cloth.

- 1 Soak the components with dish-washing detergent if the dirt is thick and ingrained.
- **2** After leaving it to soak for a short time, remove the dirt and mud with a sponge, brush and toothbrushes.
- **3** Rinse off the components with water from a watering can.
- 4 Wipe away oil stains with a degreaser.

7.3.5 Cleaning the stem

- 1 Clean stem with a cloth and soapy water.
- **2** Rinse off component with water from a watering can.

7.3.6 Cleaning the handlebars

- 1 Clean handlebars, including handles and all gears or twist grips, with a cloth and soapy water.
- 2 Rinse off component with water from a watering can.

7.3.7 Clean handles

- 1 Clean handles with sponge, water and soapy water.
- 2 Rinse off component with water from a watering can.
- **3** Care for rubber handles after cleaning (see Section 7.4.8).

7.3.7.1 Cleaning leather handles

Leather is a natural product and has similar properties to human skin. Regular cleaning and care help to prevent leather dehydrating, fading or becoming brittle or stained.

- 1 Remove dirt with a soft, damp cloth.
- 2 Remove stubborn stains with a leather cleaner.
- **3** Care for leather handles after cleaning (see Section 7.4.8.2).

7.3.8 Cleaning the seat post

- 1 Clean seat post with a cloth and soapy water.
- **2** Rinse off component with water from a watering can.
- **3** Wipe away any grease or assembly paste residue with a cloth and degreaser.

7.3.9 Cleaning the saddle

- 1 Clean the saddle with lukewarm water and a cloth dampened with soapy water.
- 2 Rinse off component with water from a watering can.
- 7.3.9.1 Cleaning the leather saddle
 - ō -

Leather is a natural product and has similar properties to human skin. Regular cleaning and care help to prevent leather dehydrating, fading or becoming brittle or stained.

- 1 Remove dirt with a soft, damp cloth.
- 2 Remove stubborn stains with a leather cleaner.
- **3** Care for leather saddle after cleaning (see Section 7.4.11).

7.3.10 Cleaning the tyres

- 1 Clean tyres with a sponge, a brush and soap cleaner.
- 2 Rinse off component with water from a watering can.
- **3** Remove any embedded chips and small stones.
- 7.3.11 Cleaning the spokes and spoke nipples
- 1 Clean spokes from the inside to the outside with a sponge, brush and soapy water.
- 2 Clean rim with a sponge.
- **3** Rinse off component with water from a watering can.
- **4** Care for spoke nipples after cleaning (see Section 7.4.13).

7.3.12 Clean hub

- **1** Put on protective gloves.
- 2 Remove dirt from hub with a sponge and soapy water.
- **3** Rinse off component with water from a watering can.
- 4 Wipe off oily dirt with a degreaser and a cloth.
- 7.3.13 Cleaning the switching elements

- 1 Clean gear shift and shift cables with water, a brush and dish-washing detergent.
- **2** Rinse off component with water from a watering can.
- 7.3.13.1 Cleaning the shifter

- ► Carefully clean shifter with a damp, soft cloth.
- 7.3.14 Clean cassette, chain wheels and front derailleur

- 1 Put on protective gloves.
- **2** Spray cassette, chain wheels and front derailleur with degreasing agent.
- **3** Clean coarse dirt with a brush after soaking for a short time.
- 4 Wash down all parts with dish-washing detergent and a toothbrush.
- **5** Rinse off component with water from a watering can.

7.3.15 Clean brake

7.3.15.1 Clean handbrake

 Carefully clean the handbrake with a damp, soft cloth.

7.3.16 Cleaning the brake disc

Notice

- Protect brake disc against lubricants and grease from hands.
- 1 Put on protective gloves.
- 2 Spray brake disc with brake disc cleaning spray.
- 3 Wipe with a cloth.
- 7.3.17 Cleaning the belt

Notice

- Never use aggressive (acid-based) cleaners, rust removers or degreasers when cleaning the belt.
- 1 Dampen a cloth with soapy water. Place the cloth on the belt.
- **2** Hold and apply slight pressure while slowly turning the rear wheel so that the belt passes through the cloth.

7.3.18 Cleaning the chain

ŴŴ Ø $\left(\widehat{\mathfrak{m}} \right)$ (A ÷.

Notice

- Never use aggressive (acid-based) cleaners, rust removers or degreasers when cleaning the chain.
- ▶ Never use gun oil or rust remover spray.
- Never use chain cleaning devices or chain cleaning baths.
- ► Have chain with all-round guard cleaned and cared for during major inspection.
- ✓ Place newspaper or paper towels underneath to collect dirt.
- 1 Slightly dampen a brush with dish-washing liquid. Brush both sides of the chain.
- **2** Dampen a cloth with soapy water. Place the cloth on the chain.
- **3** Hold and apply slight pressure while slowly turning the rear wheel, so the chain passes through the cloth.
- **4** Wipe off oily, dirty chains thoroughly with a cloth and degreaser.
- **5** Care for the chain after cleaning (see Section 7.4.16).
- 7.3.18.1 Clean chain, including all-round chain guard

Notice

The chain guard must be removed before cleaning. Contact specialist dealer.

- Clean water hole on the chain guard lower surface.
- Care for the chain after cleaning (see Section 7.4.16.1).

7.4 Maintenance

Complying with these servicing instructions is the only way to reduce wear on components, increase the operating hours and guarantee safety.

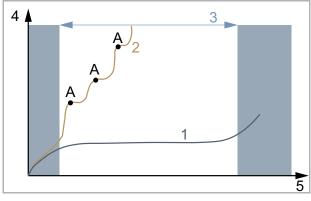

Figure 134: Diagram showing wear, operating hours (x) vs. material erosion (y)

The service life (3) of an optimally serviced drive chain (1) is almost three times as long with lubrication (A) compared to a drive chain (2) lubricated on an irregular basis.

These tools and cleaning agents are required for servicing:

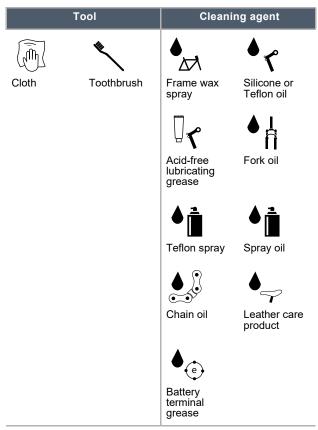

Table 49: Required tools and cleaning agents for servicing

7.4.1 Maintain frame

Notice

- Hard wax polish and protection wax are particularly resistant on gloss paintwork. These car accessory retail products are unsuitable for matt paint finishes.
- Try wax spray out on a small spot before application.
- **1** Dry frame with a cloth.
- 2 Spray frame with spray wax and leave to dry.
- 3 Wipe away any wax residue with a cloth.

7.4.2 Maintain fork

Notice

- Hard wax polish and protection wax are particularly resistant on gloss paintwork. These car accessory retail products are unsuitable for matt paint finishes.
- Try wax spray out on a small spot before application.
- **1** Dry fork with a cloth.
- 2 Spray frame care oil on frame and leave to dry.
- 3 Wipe away any wax residue with a cloth.

7.4.3 Maintain pannier rack

•

- 1 Dry pannier rack with a cloth.
- 2 Spray pannier rack with spray wax and leave to dry.
- 3 Wipe pannier rack with a cloth.
- 4 Protect chafing points on panniers with adhesive film. Replace worn adhesive film.
- **5** Maintain coil springs with silicone spray or wax spray from time to time.

7.4.4 Maintain mudguard

- (i)
- Depending on the requirements for the material in the mudguard, apply hard wax polish, metal polish or a plastic care product as per the product instructions.

7.4.5 Servicing the kickstand

- ۵ •۲ آr
- 1 Dry kickstand with a cloth.
- 2 Spray kickstand rack with spray wax and leave to dry.
- 3 Wipe down kickstand with a cloth.
- 4 Lubricate the kickstand joints with spray oil.

7.4.6 Maintaining the stem

- 1 Spray painted and polished metal surfaces with wax spray and leave to dry.
- 2 Wipe away any wax residue with a cloth.
- **3** Apply silicone or Teflon oil to the stem shaft tube and the quick release lever pivot point with a cloth.

- 4 If you have a Speedlifter Twist, also apply oil to the unlocking bolt groove in the Speedlifter body.
- 5 Apply a little acid-free lubricant grease between the stem quick release lever and the sliding piece to reduce the quick release lever operating force.
- 6 If you have a stem with a cone clamp, apply a new protective layer of assembly paste onto the stem and fork steerer contact point once a year.

7.4.7 Maintaining the handlebars

🖲 🔸 🕻

- 1 Spray painted and polished metal surfaces with wax spray and leave to dry.
- 2 Wipe away any wax residue with a cloth.
- 7.4.8 Maintaining the handles
- 7.4.8.1 Maintaining the rubber handles
- 1 Apply talcum powder to sticky rubber handles.

Notice

 Never apply talcum powder to leather or foam handles.

7.4.8.2 Maintaining the leather handles

●___

Standard leather care products keep leather smooth and resistant, brighten its appearance and improve or replace stain protection.

- 1 Try leather care product out on a less visible spot before use.
- **2** Care for leather handles with a leather care product.

<u>م</u> • ۲ ارم

7.4.9 Maintaining the seat post

- 1 Carefully preserve screw connections with wax spray. In doing so, ensure that no wax is applied to the metal contact surfaces.
- 2 Replace the assembly paste protective layer on the metal contact surfaces on the seat post and seat tube every year.

7.4.9.1 Maintaining the suspension seat post

- •r •r
- **1** Lubricate articulated joints with spray oil.
- 2 Deflect and let the suspension seat post rebound five times. Remove any surplus lubricant with a clean cloth.

7.4.9.2 Maintaining the carbon seat post

<u>م</u> • ۲ ارم

Notice

Rain and puddle water can cause contact corrosion if carbon seat posts are used in an aluminium frame without protective assembly paste. It may then take a great deal of force to remove the seat post. The carbon seat post may break as a result.

- 1 Take out the carbon seat post.
- 2 Remove old assembly paste with a cloth.
- **3** Apply new assembly paste with a cloth.
- 4 Re-insert the carbon seat post.

7.4.10 Maintaining the rims

- 🖲 •r 🔽
- Care for chrome rims, stainless steel rims and polished aluminium with chrome or metal polish. Never maintain the brake surface with polish.

7.4.11 Maintaining the leather saddle

•____

Standard leather care products keep leather smooth and resistant, brighten its appearance and improve or replace stain protection.

- 1 Try leather care product out on a less visible spot before use.
- 2 Care for leather saddle from below with a leather care product. Only maintain the top of leather saddles with a leather care product if they are badly worn and dried-out.
- **3** Avoid wearing light-coloured trousers after care due to staining.
- 7.4.12 Maintaining the hub

- 1 Apply wax spray especially around the spoke holes. In doing so, ensure that no wax is applied to brake parts.
- 2 Treat rubber seals with a cloth with one or two drops of silicone spray. Never use oil if you have disc brakes.

7.4.13 Maintaining the spoke nipples

<u>ک</u> ۲ ارم

- 1 Apply wax spray onto the spoke nipples from the rim side.
- **2** Treat heavily corroded spoke nipples with a drop of penetrating of special care oil.

7.4.14 Maintaining the gear shift

- 7.4.14.1 Maintaining the rear derailleur articulated shafts and jockey wheel
 - (i)
- Treat front and rear derailleur articulated shafts and jockey wheels with Teflon spray.

7.4.14.2 Maintaining the shifter

```
A + 14
```

Notice

- Never treat shifters with degreaser or penetrating oil spray.
- Lubricate articulated joints and mechanical parts which are accessible from outside with a few drops of spray oil or precision mechanics oil.

7.4.15 Maintaining the pedals

- 1 Treat pedals with spray oil. In doing so, ensure that no lubricant is applied to the pedal surfaces.
- 2 Lubricate seals and mechanical parts sparingly with a few drops of oil.
- **3** Remove any surplus lubricant with a clean cloth.
- 4 Spray metal foot rests with silicone spray.

7.4.16 Maintaining the chain

۵ [•]۲ ۲

- ✓ Place newspaper or paper towels underneath to collect chain oil.
- 1 Lift rear wheel.
- **2** Turn the crank briskly in an anti-clockwise direction.
- **3** Use slight finger pressure to the chain oil bottle to apply a wafer-thin thread of oil to the chain links. The faster the crank is turned, the thinner the threads of oil will be.

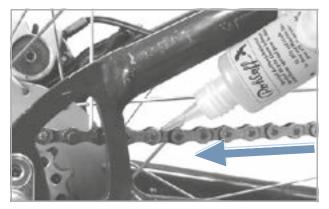

Figure 135: Lubricating the chain

- 4 Remove excessive chain oil with a cloth. If you apply too much oil, it will make the chain all the dirtier at a later point in time.
- **5** Leave chain oil to penetrate into the chain links for a few hours or overnight.

7.4.16.1 Maintaining the chain and all-round chain guard

- ۲° ۲ ₪
- ✓ Place newspaper or paper towels underneath to collect chain oil.
- 1 Lift rear wheel.
- 2 Turn the crank briskly in an anti-clockwise direction.
- 3 Use slight finger pressure to the chain oil bottle to apply a wafer-thin thread of oil onto the chain links through the oil hole on the upper surface of the chain guard. The faster the crank is turned, the thinner the threads of oil will be.
- 4 Remove excessive chain oil with a cloth. If you apply too much oil, it will make the chain all the dirtier at a later point in time.
- **5** Leave chain oil to penetrate into the chain links for a few hours or overnight.

7.4.17 Maintaining the battery

- **♦**⊕
- Grease plug terminals on the battery with terminal grease or contact spray from time to time.

7.4.18 Maintaining the brake

7.4.18.1 Maintaining the handbrake

🖻 🔸 🗸

Notice

- Never treat brake handbrake with degreaser or penetrating oil spray.
- Lubricate articulated joints and mechanical parts which are accessible from outside with a few drops of spray oil or precision mechanics oil.
- 7.4.19 Lubricating the Eightpins seat post tube
- Use a 2.5 ml syringe to carefully fill Eightpins Fluid V3 very slowly into the lubricating nipple on the outer tube.

Figure 136: Lubricating the Eightpins seat post

Notice

Fill a maximum of 2.5 ml since otherwise the reservoir inside will overflow and the oil will spill into the frame.

7.5 Inspection

The following tools are required for an inspection:

	Gloves
2	Ring spanners 8 mm, 9 mm, 10 mm, 13 mm, 14 mm and 15 mm
	Torque spanner Working range 5… 40 Nm
۲	by.schulz handlebars: TORX® bits: T50, T55, and T60
0	Hex key 2 mm, 2.5 mm, 3 mm, 4 mm, 5 mm, 6 mm and 8 mm
0	Phillips screwdriver
•	Slotted-head screwdriver

Table 50: Tools required for inspection

7.5.1 Checking the wheel

- 1 Hold pedelec.
- 2 Hold onto the front or rear wheel and try to move the wheel sideways. In doing so, check to see if the wheel nuts or quick releases move.
- ⇒ If the wheel moves or the wheel nut or quick release moves sideways, take pedelec out of service. Contact specialist dealer.
- 3 Lift pedelec slightly. Turn front or rear wheel. In doing so, check whether the wheel deflects sideways or outwards.
- ➡ If the wheel deflects sideways or outwards, take pedelec out of service. Contact specialist dealer.

7.5.1.1 Checking tyre pressure

Notice

If the tyre pressure is too low in the tyre, the tyre does not achieve its load bearing capacity. The tyre is not stable and may come off the rim.

If the tyre pressure is too high, the tyre may burst.

Tyres are wear parts and wear away due to fatigue, storage, environmental influences or mechanical impacts. Only optimum tyre pressure will guarantee greater safety, lower rolling resistance, effective protection against punctures and a longer service life.

Air loss

Even the most airtight tube will lose pressure on a continuous basis since the air pressures in a pedelec tyre are significantly higher and the wall thicknesses significantly finer than in a car tyre. Pressure loss of 1 bar per month can be regarded as normal. During this process, the pressure loss is significantly faster at high pressures and significantly slower at low pressures.

Checking tyre pressure

The permitted pressure range is indicated on the side of the tyre.

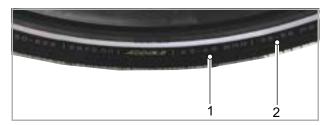

Figure 137: Tyre pressure specification in bar (1) and psi (2)

Verify tyre pressure against the value noted in the pedelec pass every 10 days as a minimum.

Dunlop valve

Only applies to pedelecs with this equipment

The tyre pressure cannot be measured on the simple Dunlop valve. You thus measure the tyre pressure in the filling hose while slowly pumping the bicycle air pump.

- ✓ It is recommendable to use a bicycle air pump with a pressure gauge.
- 1 Unscrew and remove the valve cap.
- 2 Undo the rim nuts.
- 3 Connect the bicycle air pump.
- 4 Pump up the tyre slowly and pay attention to the tyre pressure in the process.
- **5** Correct the tyre pressure to meet the specified value in the Pedelec pass.
- 6 If the tyre pressure is too high, unfasten the union nut, let air out and re-tighten the union nut.
- 7 Remove the bicycle air pump.
- 8 Screw the valve cap tight.
- **9** Screw the rim nut gently against the rim with the tips of your fingers.
- ➡ Correct tyre pressure if necessary (see section 6.5.8).

Schrader valve

Only applies to pedelecs with this equipment

- ✓ It is recommended to use an air pump at a filling station or a modern bicycle air with a pressure gauge. Older and simple bicycle air pumps are unsuitable for filling tyres via a Schrader valve.
- 1 Unscrew and remove the valve cap.
- 2 Undo the rim nuts.
- **3** Connect the bicycle air pump.
- 4 Pump up the tyre slowly and pay attention to the tyre pressure in the process.
- ⇒ The tyre pressure has been adjusted as per the specifications.

- 5 Remove the bicycle air pump.
- 6 Screw the valve cap tight.
- 7 Screw the rim nut gently against the rim with the tips of your fingers.
- ➡ Correct tyre pressure if necessary (see section 6.5.8).

Presta valve

Only applies to pedelecs with this equipment

- ✓ It is recommendable to use a bicycle air pump with a pressure gauge. You must observe the bicycle air pump operating instructions.
- 1 Unscrew and remove the valve cap.
- 2 Open the knurled nut around four turns.
- **3** Carefully attach the bicycle air pump so that you do not bend the valve insert.
- 4 Pump up the tyre slowly and pay attention to the tyre pressure in the process.
- **5** Correct the tyre pressure as per the specifications on the tyre.
- 6 Remove the bicycle air pump.
- 7 Tighten the knurled nut with your fingers.
- 8 Screw the valve cap tight.
- **9** Screw the knurled nut gently against the rim with the tips of your fingers.
- ➡ Correct tyre pressure if necessary (see section 6.5.8).

7.5.1.2 Checking the tyres

The tread is far less important for bicycle tyres than it is for car tyres, for example. Consequently, tyres can still be used with a worn tread with the exception of tyres on mountain bikes.

1 Check the tread for wear. The tyre is worn if the anti-puncture protection or the carcass cords are visible.

Since resistance to punctures also depends on the thickness of the tread, it may make sense to change the tyre at an earlier stage.

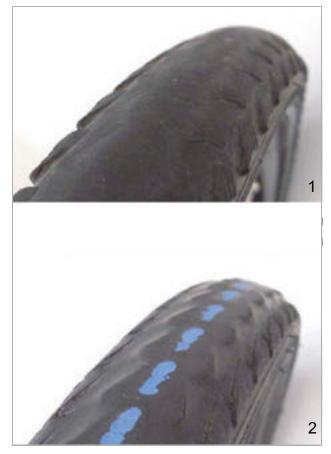

Figure 138: Tyres without a tread which can be replaced (1) and tyres with puncture protection showing through (2) must be replaced

2 Check the side walls for wear. If there are any cracks or tears, the tyre must be replaced.

Figure 139: Examples of fatigue cracks (1) and ageing cracks (2) $% \left({{{\bf{x}}_{{\rm{s}}}}} \right)$

3 Replacing a wheel requires considerable mechanical expertise. If a tyre is worn, it needs to be replaced at a specialist dealer's.

7.5.1.3 Checking the rims

Crash caused by a worn rim

A worn rim can break and block the wheel. This may cause a crash with serious injuries.

- Check rim wear on a regular basis.
- Take pedelec out of service if the rim has any cracks or warping. Contact specialist dealer.

Rims are wear parts and wear away due to fatigue, mechanical impacts, environmental influences or due to braking if rim brakes are used.

- Check the rim well for wear.
- ⇒ The rims of a rim brake with invisible wear indicator are worn as soon as the wear indicator becomes visible in the area of the rim joint.
- ⇒ The rims with visible wear indicator are worn as soon as the black, all-round groove on the pad friction surface is no longer visible.
- We recommend that you also replace the *rims* at the same time as every second brake lining replacement.

7.5.1.4 Checking the nipple holes

Nipples cause fatigue and stress on the edge of the nipple hole.

Check whether there are cracks on the edge of the nipple hole.

If there are cracks on the edge of the nipple hole, contact your specialist dealer.

7.5.1.5 Checking the nipple well

The nipple holes can weaken the tyre bed.

- Check to see if cracks are emerging from the nipple holes.
- ➡ If there are cracks radiating from the nipple hole, contact your specialist dealer.
- 7.5.1.6 Checking the rim hooks

Mechanical impacts can warp the rim hooks. There is no longer a guarantee that a tyre can be fitted safely if this is the case.

- Check for twisted rim hooks.
- ➡ Replace rims with twisted rim hooks. Never repair the rim with pliers and bend the hook back.

7.5.1.7 Checking the spokes

- Press spokes slightly together with your thumb and index finger. Check to ensure that the tension is the same for all spokes.
- ➡ Contact your specialist dealer if the spokes are loose or are tensioned differently.

7.5.2 Checking the brake system

Crash caused by brake failure

Worn brake discs and brake linings and a lack of hydraulic fluid in the brake cable reduce the braking power. This may cause a crash with serious injuries.

Check brake disc, brake linings and the hydraulic brake system regularly. Contact specialist dealer.

The inspection interval for the brake depends on how often it is used and the weather conditions. If the pedelec is used under extreme conditions such as rain, dirt or high mileage, inspection must be performed more frequently.

7.5.2.1 Checking the handbrake

- 1 Check that all screws in the handbrake are firmly in place (see Section 3.4.8).
- 2 Tighten loose screws.
- **3** Check that handbrake is torsionally rigid on the handlebars (see Section 3.4.8).
- 4 Tighten loose screws.
- 5 Check that there is a gap of at least 1 cm between the handbrake and the handle when the handbrake is fully applied.
- 6 Adjust the grip distance if the gap is too narrow (see Section 6.5.9.9).
- 7 Check the braking effect by pedalling while pulling the handbrake.
- ▶ If the braking power is too weak, adjust the brake pressure point (see Section 6.5.9.8).
- Contact your specialist dealer if the pressure point cannot be reached.

7.5.2.2 Checking the hydraulic brake system

- 1 Pull on the handbrake and check whether any brake fluid leaks out of the lines, connections or on the brake linings.
- 2 If any brake fluid leaks from anywhere, take pedelec out of service. Contact specialist dealer.
- 3 Pull brake handbrake and hold several times.
- 4 If you are unable to clearly detect the pressure point and it changes, the brake needs to be bled. Contact specialist dealer.

7.5.2.3 Checking the Bowden cables

- 1 Pull on handbrake several times. Check whether the Bowden cables get stuck or they make scraping noises.
- 2 Check the physical condition of the Bowden cables for visible damage and check to see if wire strands are broken.
- **3** Have defective Bowden cables replaced. Contact specialist dealer.

7.5.2.4 Checking the disc brake

Only applies to pedelecs with this equipment

Checking the brake linings

Check that the brake linings are no less than 1.8 mm wide at any point and there are no less than 2.5 mm between the brake lining and supporting plate.

Figure 140: Checking the brake lining when fitted with the help of the transport safety wear gauge

- 1 Check brake linings for damage and thick dirt.
- ➡ Have damaged or very dirty brake linings replaced. Contact specialist dealer.
- 2 Pull handbrake and hold.
- 3 In doing so, check whether the transport safety wear gauge can fit between the brake lining supporting plates.
- ⇒ If the transport safety wear gauge fits between the supporting plates, the brake linings have not reached their wear limit.
- ➡ Contact your specialist dealer if they are worn.

Checking the brake discs

- ✓ Put on gloves as the brake disc is very sharp.
- 1 Take hold of brake disc and wiggle it gently to check whether the brake disc is positioned against the wheel free of backlash.
- 2 Check that the brake linings move steadily and symmetrically back towards the brake disc when you pull and release handbrake.
- ➡ If the brake disc can be moved or the brake linings move erratically, contact your specialist dealer.
- **3** Check that the brake disc is no less than 1.8 mm thick at any point.
- ⇒ If the brake disc is under the wear limit and is less than 1.8 mm thick, the brake disc must be replaced. Contact specialist dealer.

7.5.3 Checking the chain

- Check chain for rust, damage and chain links that are difficult to move.
- ⇒ Replace rusted, damaged or difficult-to-move chains since they will not withstand the tensile loads from the drive and will soon break. Contact specialist dealer.

7.5.4 Checking the chain tension

Notice

Excessive chain tension increases wear. If the chain tension is too low, there is a risk that the *chain* will slip off the *chain wheels*.

Check the chain tension once a month.

7.5.4.1 Check tension in derailleur gears

The rear derailleur tensions the chain on pedelecs with derailleur gears.

- 1 Check to see if the chain is sagging.
- 2 Gently press the rear derailleur forwards to check whether it moves and whether it goes back into position by itself.
- ➡ If the chain is sagging or the rear derailleur does not go back into position by itself, contact your specialist dealer.

7.5.4.2 Check tension in hub gear

Remove the chain guard on pedelecs with a circumferential chain guard.

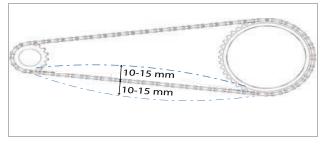

Figure 141: Checking the chain tension (example): 5 mm upwards, 10 mm downwards = 15 mm deviation

- 1 Lift chain upwards. Measure the distance to the centre. Press chain downwards. Measure the distance to the centre.
- **2** Add the two values together to calculate the deviation.
- 3 Check the chain tension at three to four points.
- ➡ If the deviation is greater than 20 mm, tighten chain.
- ➡ If the deviation is less than 10 mm, Loosen chain.
- If a hub gear is fitted, the rear wheel must be pushed backwards and forwards to tighten the chain. Contact specialist dealer.
- In the case of pedelecs with a hub gear or back-pedal brake, the chain is tensioned by an eccentric bearing or movable fork end in the bottom bracket axle. Special tools and specialist knowledge are required to tension the chain. Contact specialist dealer.

7.5.5 Checking the belt for wear

Each chain has a wear limit. If this limited is exceeded, the chain needs to be replaced.

Manufacturer	Wear limits
SHIMANO	>1%
КСМ	>0.8 mm per link
SRAM	>0.8%
ROHLOFF	S: >0.1 mm per link A: >0.075 mm per link

Table 51: Chain wear limit by manufacturer

7.5.5.1 Rough check

You can perform a rough check on the chain wheel by hand on conventional chains.

- 1 Place the chain on the largest chain wheel.
- 2 Lift the chain from the front to the centre of the bike.
- ➡ If the chain can be lifted more than half a link from the chain wheel, carry out a check or contact your specialist dealer.

7.5.5.2 Check

There is a different wear gauge for each chain, depending on the manufacturer:

Figure 142: Example of a KMC gauge

Figure 143: Example of a SHIMANO gauge

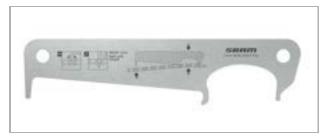

Figure 144: Example of a SRAM gauge

Figure 145: Example of a ROHLOFF gauge

Figure 146: Example of a KMC digital gauge

1 Insert gauge between two chain links on the right-hand side.

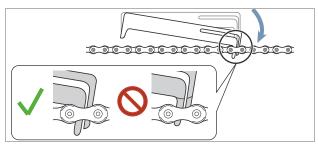

Figure 147: Gauge is inserted

2 Lower gauge down to the left-hand side.

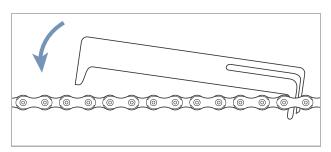

Figure 148: Lower gauge to the left

➡ If the gauge does not fit between the links, the chain is not worn yet.

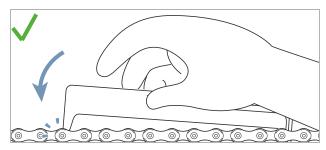

Figure 149: Gauge does not fit

➡ If the gauge does not fit between the links, the chain is worn and must be replaced. Contact specialist dealer.

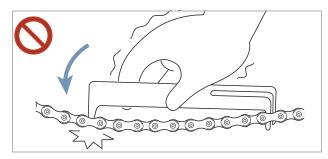

Figure 150: Gauge fits

7.5.6 Checking the belt

7.5.7 Checking the belt for wear

Check belt for indications of wear:

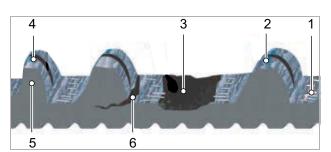

Figure 151: Indications of wear on a belt

- 1 Carbon tensile fibres are exposed
- 2 Worn webbing with visible polymer
- 3 Missing belt tooth
- 4 Imbalance
- 5 Shark tooth
- 6 Cracks
- ➡ If there is one or more indications of wear, contact your specialist dealer. The belt needs to be replaced.

7.5.8 Checking the belt sprockets for wear

- Check belt sprocket.
- ⇒ The tooth profile is rounded and the teeth are thick. The belt sprocket does not need to be replaced.

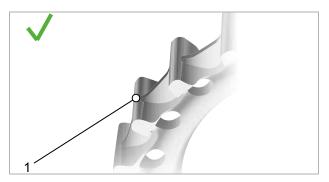

Figure 152: Optimum tooth profile

➡ The tooth profile is pointed and teeth have worn thinner. Contact specialist dealer. The belt sprocket does need to be replaced.

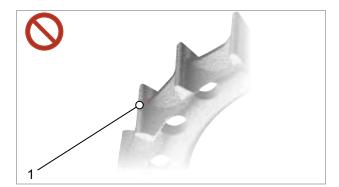

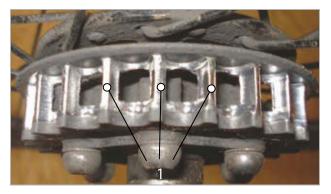

Figure 153: Worn tooth profile

7.5.9 Check belt tension

If the belt tension is too low, this can cause the system to skip over a tooth or slip, i.e. the teeth on the belt slip over the teeth on the rear wheel belt sprocket. Excessive tension can cause damage to the bearings, sluggishness in the system and increased wear on the electric drive system.

The adjustment of the belt tension varies depending on the pedelec. Common tensioning systems include angled or vertical drop-outs, horizontally sliding dropouts and eccentric bottom bracket axle.

There are three common methods of measuring belt tension:

- Gates Carbon Drive mobile app for iPhone® and Android®,
- Gates Krikit tension meter and
- Eco tension tester.

With any of these methods, the tension along the belt may vary slightly, so you should repeat the process several times. Turn the pedal a quarter after each measurement. Measure again.

The tools measure the tension only. They do not provide specifications for the required voltage. The table below contains specifications for the correct tensioning range for Gates Carbon Drive belts.

	Steady pedalling	Sports Use
MTBs* and single- speed bicycles	45– 60 Hz (35– 45 lbs)	60– 75 Hz (45– 53 lbs)
Hub gear/pinion gear	35– 50 Hz (28– 40 lbs)	

Table 52: Specifications for tensioning

* The CDN and SideTrack systems are not permitted for mountain bikes, e-bikes with middrive motor or gears, bikes without a gear shift or for trekking or touring bikes.

These tension specifications are designed as initial guidance and may have to be corrected upwards or downwards depending on the body size, gear ratio and the force applied to the pedals.

7.5.9.1 Gates Carbon Drive mobile app

The Gates Carbon Drive mobile app measures the belt tension based on the belt's natural frequencies (Hz). To do so, the app uses the phone's mic to record the sound of the belt and

determines the main frequency.

- ✓ Download Gates Carbon Drive mobile app free of charge from the App Store or Google Play on your mobile phone.
- ✓ Measure in a quiet environment.
- Ensure that the phone microphone is switched on.

- 1 Open app.
- 2 Click on the voltage symbol.
- 3 Click on MEASURE.
- 4 Point phone microphone towards the belt.
- **5** Pluck the belt so that the belt vibrates like a guitar string.
- 6 It is recommended to take several measurements for comparison. Turn the crank a quarter. Repeat frequency measurement.
- 7 Check the belt frequency displayed against the specifications for tensions in Table 52.
- ➡ If the value is higher than the specification, reduce belt tension.
- ➡ If the value is within the specified range, the belt tension has been correctly adjusted.
- ➡ If the value is lower than the specification, increase belt tension.

7.5.9.2 Gates Krikit tension meter

Not included in price

- ✓ Check that the measurement indicator is at the very bottom.
- 1 Extend index finger into the finger loop. Place on the check gauge.

Figure 155: Index finger in the check gauge

2 Position check gauge on the upper surface of the belt. Position the check gauge in the middle of the belt length.

Figure 156: Check gauge on belt

3 Press the check gauge down with just one finger until it clicks into place.

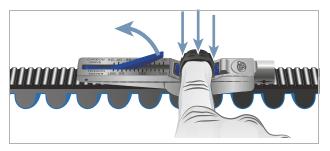

Figure 157: Pressing the check gauge down with one finger

4 Take reading where line A meets line B.

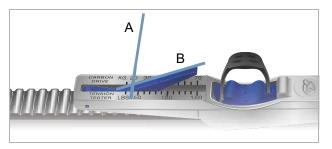

Figure 158: Example of a reading: 20 kg

- **5** Turn the pedal a quarter. Repeat measurement at least three times.
- 6 Convert value read from kg to pounds. The value is given in inches per pound.
 Example: 20 kg = 44 inch = 44 lbs
- 7 Compare value with Table 44 Tension specification.
- ➡ If the value is higher than the specification, reduce belt tension.
- ➡ If the value is within the specified range, the belt tension has been correctly adjusted.
- ➡ If the value is lower than the specification, increase belt tension.

7.5.9.3 ECO tension tester Not included in price

1 Attach the measuring stick on the belt.

Figure 159: Attached measuring stick

2 Place the ruler on both belt sprockets.

Figure 160: Ruler in place

⇒ Read tension on the tension indicator.

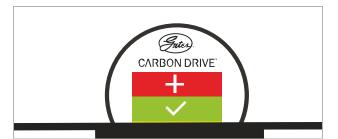

Figure 161: Example: On yellow along lower edge, so reduce belt tension slightly

Red = increase belt tension Green = belt tension is set correctly Yellow = reduce belt tension

7.5.10 Checking the riding light

- 1 Check the cable connections on the headlight and rear light for damage and corrosion and ensure they are firmly in position.
- ➡ If cable connections are damaged or corroded, or are not firmly in positioned. take pedelec out of service. Contact specialist dealer.
- 2 Switch light on.
- **3** Check that the headlight and rear light come on.
- ⇒ If the headlight or rear lights do not come on, take pedelec out of service. Contact specialist dealer.
- 4 Place pedelec 5 m from the wall.
- **5** Stand the pedelec up straight. Hold the handlebars straight with both hands. Do not use the kickstand.

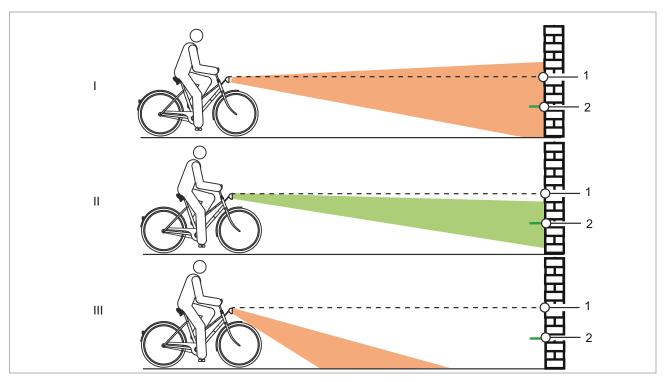

Figure 162: Light positioned too high (1), correctly (2) and too low (3)

- 6 Check the position of the light beam.
- ➡ If the light is positioned too high or too low, adjust riding light (see Section 6.5.13.1).

7.5.11 Checking the stem

- The stem and quick release system must be inspected at regular intervals. The specialist dealer should adjust them if they require adjustment.
- If the hexagon socket head screw is also loosened, the bearing clearance also needs to be adjusted. Medium-strength thread locker, such as Loctite blue, then needs to be applied to the loosened screws and the screws tightened as per specifications.
- Check metal contact surfaces on cone, stem clamping screw and fork steerer for corrosion.
- ⇒ Take pedelec out of service if there is any wear or signs of corrosion. Contact specialist dealer.

7.5.12 Checking the handlebars

- 1 Take hold of handlebars with both hands on the handles.
- 2 Move handlebars up and down and press to tilt.
- ➡ If the handlebars can move, contact your specialist dealer.
- **3** Place front wheel in position where it can't move sideways (e.g. in a bike stand).
- 4 Hold handlebars firmly with both hands.
- **5** Check if the handlebars are able to twist against the front wheel.
- ➡ If the handlebars can move, contact your specialist dealer.

7.5.13 Checking the saddle

- 1 Hold saddle firmly.
- 2 Check whether the saddle twists, tilts or can be pushed in one direction or other.
- ➡ If the saddle twists, tilts or can be pushed in one direction or other, adjust the saddle (see Section 6.5.4).
- ➡ Contact your specialist dealer if the saddle cannot be fixed into position.

7.5.14 Checking the seat post

- **1** Take seat post out of the frame.
- 2 Check seat post for cracks and corrosion.
- 3 Reinsert seat post.

7.5.15 Check pedal.

- 1 Hold pedal and try to move it sideways toward the inside or outside. In doing so, observe whether the crank arm or bearing move sideways.
- ➡ If the pedal, crank arm or crank bearing moves sideways, fasten screw on the pedal crank rear.
- 2 Hold pedal and try to move it upwards and downwards vertically. In doing so, observe whether the pedal, crank arm or crank bearing moves vertically.
- ➡ If the pedal, crank arm or crank bearing moves vertically, fasten screw.
- 7.5.15.1 Checking the derailleur gears

The chain is tensioned by the rear derailleur in pedelecs with derailleur gears.

- 1 Place the pedelec on stand.
- 2 Check to see if the chain is sagging.
- **3** Gently press the rear derailleur forwards to check whether it moves and whether it goes back into position by itself.
- ➡ If the chain is sagging or the rear derailleur does not go back into position by itself, contact your specialist dealer.

7.5.15.2 Checking the hub gear

In the case of pedelecs with a hub gear or backpedal brake, the chain or the belt is tensioned by an eccentric bearing or movable fork end in the bottom bracket axle. Special tools and specialist knowledge are required to tension the chain. Contact specialist dealer.

- ✓ Remove the chain guard on pedelecs with a circumferential chain guard.
- 1 Place the pedelec on stand.
- 2 Check the chain or belt tension in three or four positions, turning the crank a full revolution.

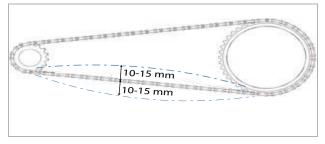

Figure 163: Checking the chain tension (example): 5 mm upwards, 10 mm downwards = 15 mm deviation

- 3 If the chain or the belt can be pushed more than 2 cm, the chain will need to be re-tensioned. Contact specialist dealer.
- ⇒ If the chain or belt can only be pushed up and down less than 1 cm, you will need to the chain or belt slightly. Contact specialist dealer.
- ➡ The ideal chain and belt tension has been achieved if the chain can be pushed between a maximum of 10 and 15 mm in the middle between the pinion and the toothed wheel. The crank must also turn without resistance.

7.5.16 Check gear shift

- 1 Check that all gear shift components are free of damage.
- **2** Contact your specialist dealer if components are damaged.
- 3 Place the pedelec on stand.
- 4 Turn the pedal crank clockwise.
- 5 Switch through all speeds.
- **6** Check that pedelec can switch through all speeds without making unusual noises.
- 7 Adjust the gear shift if gears cannot be changed correctly.
- 7.5.16.1 Checking the electric gear shift
- 1 Check the cable connections for damage and corrosion and ensure they are firmly in position.
- ➡ If cable connections are loose, damaged or corroded, contact your specialist dealer.
- 7.5.16.2 Check the mechanical gear shift
- 1 Change gear a number of times. Check whether the Bowden cables get stuck or they make scraping noises.
- 2 Check the physical condition of the Bowden cables for visible damage and check to see if wire strands are broken.
- ➡ Have defective Bowden cables replaced. Contact specialist dealer.

7.5.16.3 Checking the derailleur gears

- 1 Check that there is clearance between the chain tensioner and spokes.
- ➡ If there is no clearance or the chain scrapes against the spokes or tyres, contact your specialist dealer.
- 2 Check that there is clearance between the chain or rear derailleur and spokes.
- ➡ If there is no clearance or the chain scrapes against the spokes, contact your specialist dealer.

7.5.17 Adjusting gear shift

7.5.17.1 Adjusting the ROHLOFF hub

Only applies to pedelecs with this equipment

- Check whether shift cable tension is set in such a way that there is a perceptible play of around 5 mm when the shift handle is turned.
- 2 Adjust the shift cable tension by turning the **tension adjuster**.
- ➡ Unscrew the **tension adjuster** to increase the shift cable tension.
- ➡ Tighten the tension adjuster to decrease the shift cable tension.

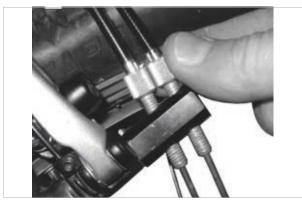

Figure 164: The tension adjuster on ROHLOFF hub versions with internal switch control is located on the tension counter support

Figure 165: The tension adjuster on ROHLOFF hub versions with external switch control is located on the cable box positioned on the left-hand side

3 If the marking and numbers on the shift handle to no longer coincide after the gear shift is adjusted, tighten one of the tension adjusters and screw out the other tension adjuster to the same extent.

7.5.18 Adjusting cable-operated gear shift, dual-cable

Only applies to pedelecs with this equipment

- For a smooth gear shift, adjust the adjusting sleeves underneath the chain stay on the frame.
- The shift cable has around 1 mm play when it is pulled out gently.

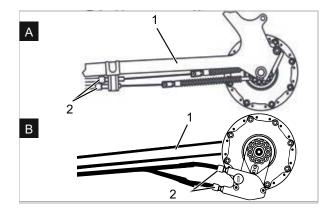

Figure 166: Adjusting sleeves (2) on two alternative versions (A and B) of a dual-cable, Bowden-cable-operated gear shift on the chain stay (1)

7.5.19 Adjusting Bowden-cable-operated twist grip, dual-cable

Only applies to pedelecs with this equipment

- For a smooth gear shift, adjust the adjusting sleeves on the shifter housing.
- ⇒ There is noticeable play of 2 to 5 mm (1/2 gear) when you turn the twist grip.

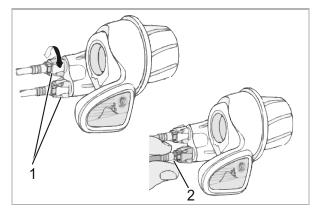

Figure 167: Twist grip with adjusting sleeves (1) with play (2)

7.5.20 Checking kickstand stability

- 1 Place the pedelec on a slight elevation of 5 cm.
- 2 Extend kickstand.
- 3 Jolt pedelec to check stability.
- ➡ If pedelec topples over, tighten screws or change height of the kickstand.

8 Inspection and maintenance

8.1 Initial inspection

After 200 km or 4 weeks after purchase

Vibrations produced while riding can cause screws and springs that were tightened during pedelec manufacture to settle or come loose.

- Arrange an appointment for the initial inspection directly when purchasing the pedelec.
- Have the initial inspection entered and stamped in the maintenance book.
- Carrying out the initial inspection, see Section 8.4.

8.2 Major inspection

every six months

You must have your specialist dealer perform a major inspection every six months as a minimum. This is the only way to ensure that the pedelec remains safe and fully functional.

Tasks require technical expertise, special tools and special lubricants. The pedelec may become damaged if the stipulated major inspection and procedures are not carried out. This is why only specialist dealers may carry out the major inspection.

- Contact your specialist dealer and arrange an appointment.
- Enter and stamp major inspection tasks in the maintenance book.

Perform major inspection.

8.3 Component-specific maintenance

High-quality components require extra maintenance. Tasks require technical expertise, special tools and special lubricants. The pedelec may become damaged if the stipulated maintenance intervals and procedures are not carried out. This is why only specialist dealers may carry out maintenance.

Correct maintenance on the fork not only guarantees a long service life, but also ensures optimal performance.

Each maintenance interval shows the maximum cycling hours for the required type of maintenance that the component manufacturer recommends.

- Optimise performance with shorter maintenance intervals, depending on use, terrain and environmental conditions.
- Enter any components with extra maintenance requirements with their corresponding maintenance intervals into the maintenance book when the pedelec is purchased.
 - Inform the buyer of the additional maintenance schedule.
 - Enter and stamp maintenance tasks in the maintenance book.

Inspection and maintenance intervals for suspension fork		
SR SUNTOUR suspension fork		
	Maintenance 1	Every 50 hours
	Maintenance 2	Every 100 hours

	Maintenance 1 Check drive elements and replace if necessary Clean cable pulley, slide surfaces and gear box interior, epicyclic wheels, etc. thoroughly and grease generously	Every 500 km					
	Maintenance 2 Replace chain rings and change oil	Every 10,000 km					

Injury due to damaged brakes

Special tools and specialist knowledge are required to repair the brakes. Incorrect or unauthorised assembly can damage the brakes. This may lead to an accident with serious injuries.

- Only specialist dealers may carry out repairs on brakes.
- Only carry out work or changes, such as dismantling, sanding or painting, which are permitted and described in the brake operating instructions.

Injury to the eyes

Problems may arise if the settings are not made properly and you may sustain serious injuries as a result.

Always wear safety glasses during Inspection and maintenance work.

Crash and falling caused by unintentional activation

There is a risk of injury if the electric drive system is activated unintentionally.

 Remove the battery before inspection or maintenance.

Crash caused by material fatigue

If the service life of a component has expired, the component may suddenly fail. This may cause a crash with injuries.

Have the specialist dealer carry out basic cleaning of the pedelec every six months, preferably at the same time as the required servicing work.

Hazard for the environment due to toxic substances

The brake system contains toxic and environmentally harmful oils and lubricants. Such fluids will contaminate if they enter the sewers or groundwater.

Dispose of lubricants and oils left over after repairs in an environmentally responsible way in accordance with statutory regulations.

Notice

The motor is maintenance-free and only qualified specialist personnel may open it.

▶ Never open the motor.

8.4 Carry out initial inspection

Incorrectly fastened screws may come loose due to impact. The stem may no longer be firmly fixed in its position as a result. This will cause a crash with injuries.

Check the handlebars and the stem quick release system are firmly in position after the first two hours of riding.

Vibrations produced while riding can cause screws and springs that were tightened during manufacture of the pedelec to settle or come loose.

- 1 Check quick release system is fixed in position.
- **2** Check all tightening torques of screws and screw connections.

ß

8.5 **Perform major inspection**

Complying with these inspection and maintenance instructions is the only way to reduce wear on components, increase the operating hours and guarantee safety.

Diagnosis and documentation of current status

Components	Frequency		Description		C	riteria	Measures if rejected

8.5.1 Inspect frame

- 1 Check frame for cracks, warping and damage to the paintwork.
- ➡ If there are any cracks, warping or damage to the paintwork, remove the pedelec from service. New frame as specified in the parts list.

8.5.1.1 Inspecting the carbon frame

You need to distinguish between scratches on the paintwork and impacts if the carbon frame paintwork is damaged.

- Ask customer what caused the damage.
- Examine damage with a magnifying glass to see if fibres are permanently damaged or delamination has taken place.

8.5.2 Inspecting the pannier rack

Scratches, cracks and breaks may appear on the pannier rack caused by the panniers and cargo boxes.

- 1 Examine pannier rack for scratches, cracks and breaks.
- ➡ Replace damaged pannier racks.
- ➡ If the paint protection film is missing or has worn away, affix a new paint protection film.

8.5.3 Inspecting and maintaining the rear frame damper

Only applies to pedelecs with this equipment

WARNING

Injury due to explosion

The air chamber is pressurised. If the air system is serviced in a rear frame damper, it can explode and cause serious injury.

- Wear safety goggles, protective gloves and safety clothing when assembling or carrying out maintenance on the bicycle.
- Release the air for the air chambers. Detach all air insert fitments.
- Never service or dismantle a rear frame damper if it has not completely rebounded.

Intoxication from suspension oil

Suspension oil is poisonous to the touch, irritates respiratory tracts and causes cancer, sterility and mutation in germ cells.

- Always wear safety goggles and nitrile gloves when carrying suspension oil.
- Never perform inspection or maintenance when you are pregnant.
- Use an oil catchment tray under the section where the rear frame damper is being serviced.

Intoxication from lubrication oil

The lubrication oil for Eightpins seat posts is toxic if touched or inhaled.

- Always wear safety goggles and nitrile gloves when working with lubrication oil.
- Lubricate seat post in the open air or in a wellventilated room only.
- Avoid skin coming into contact with lubrication oil. Wear nitrile gloves when lubricating, cleaning and maintaining the vehicle.
- Use an oil catchment tray under the section where the seat post is serviced.

Hazard for the environment due to toxic substances

The rear frame damper contains toxic and environmentally harmful oils and lubricants. Such fluids will contaminate if they enter the sewers or groundwater.

- Dispose of lubricants and oils left over after repairs in an environmentally responsible way in accordance with statutory regulations.
- 1 Dismantle the rear frame damper.
- 2 Clean and inspect its interior and exterior.
- 3 Recondition air springs.
- 4 Replace airtight seals on air springs.
- 5 Change oil.
- ⇒ Replace dust wipers.
- 8.5.4 Inspecting the gear hub

8.5.4.1 Adjusting the hub with cone bearing

In the case of hubs with a cone bearing, the bearing shell fixed in the hub cone body rotates with its larger ball bearing surfaces around the inner bearing cone resting against the fork end. The outer bearing shell rotating around the stationary bearing cone is subject to considerably more evenly distributed loads thanks to its larger ball running surface.

- **1** Attach a small, red colour marking on the lock nut.
- **2** Turn the wheel axle 40° to 90° every 1,000 to 2,000 km.
- ➡ The bearing cone is subject to evenly distributed loads.

8.5.5 Inspecting the stem

Incorrectly fastened screws may come loose due to impact. The stem may no longer be firmly fixed in its position as a result. This will cause a crash with injuries.

- Check the handlebars and the stem's quick release are firmly in position.
- 8.5.6 Inspect and grease steering headset
- 1 Remove fork.
- 2 Clean steering headset. If it is very dirty, flush the bearing with cleaning agents such as WD-40 or Karamba.
- 3 Check steering headset for damage.
- ➡ If the steering headset is damaged, replace steering headset as specified in the parts list.
- 4 Grease steering headset and bearing seat with highly viscous, water-repellent grease (e.g. Dura Ace special grease by SHIMANO).
- **5** Re-fit fork with steering headset as per fork instructions.

8.5.7 Inspecting the axle with quick release

Crash caused by unfastened quick release

A faulty or incorrectly installed quick release may become caught in the brake disc and block the wheel. This will cause a crash.

Install the front wheel quick release lever on the opposite side to the brake disc.

Crash caused by faulty or incorrectly installed quick release

The brake disc becomes very hot during operation. Parts of the quick release may become damaged as a result. The quick release comes loose. This will cause a crash with injuries.

The front wheel quick release lever and the brake disc must be situated on opposite sides.

Crash caused by incorrectly set clamping force

Excessively high clamping force will damage the quick release and cause it to lose its function.

Insufficient clamping force will cause a detrimental transmission of force. The suspension fork or the frame may break. This will cause a crash with serious injuries.

- Never fasten a quick release using a tool (e.g. hammer or pliers).
- Only use the clamping lever with the specified set clamping force.
- 1 Undo quick release.
- 2 Fasten quick release.
- **3** Check the position and clamping force of the quick release lever.

- ⇒ The quick release lever is flush with the lower housing.
- ⇒ You should be able to see slight impression on the palm of your hand when you close the quick release lever.

Figure 168: Adjusting the quick release clamping force

- **4** Use a 4 mm hexagon socket spanner to adjust the clamping lever clamping force if required.
- **5** Check the quick release lever position and clamping force again.

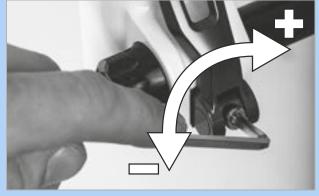

Figure 169: Adjusting the quick release clamping force

8.5.8 Inspecting the fork

Injury due to explosion

The air chamber is pressurised. When the air system in a faulty suspension fork is maintained, it may explode and cause serious injury.

- Wear safety goggles, protective gloves and safety clothing when assembling or carrying out maintenance on the bicycle.
- Release the air for the air chambers. Detach all air insert fitments.
- Never service or dismantle a suspension fork if it has not completely rebounded.

Hazard for the environment due to toxic substances

The suspension fork contains toxic and environmentally harmful oils and lubricants. Such fluids will contaminate if they enter the sewers or groundwater.

- Dispose of lubricants and oils left over after repairs in an environmentally responsible way in accordance with statutory regulations.
- 1 Remove fork.
- 2 Check fork for cracks, warping and damage to the paintwork.
- ➡ If there are any cracks, warping or damage to the paintwork, remove the pedelec from service. New fork as specified in the parts list.
- 3 Clean inside and exterior.
- 4 Grease fork.
- 5 Install fork.

8.5.8.1 Inspecting the carbon suspension fork Only applies to pedelecs with this equipment

- 1 Remove fork.
- 2 Check fork for cracks, warping and damage to the paintwork.
- **3** You need to distinguish between scratches on the paintwork and impacts if the carbon suspension fork paintwork is damaged.
- Ask customer what caused the damage.
- Examine damage with a magnifying glass to see if fibres are permanently damaged or delamination has taken place.
- 8.5.8.2 Inspecting the suspension fork

Only applies to pedelecs with this equipment

- 1 Remove fork.
- 2 Check fork for cracks, warping and damage to the paintwork.
- ⇒ If there are any cracks, warping or damage to the paintwork, remove the pedelec from service. New fork as specified in the parts list.
- 3 Dismantle suspension fork.
- 4 Lubricate dust seals and slide bushings.
- 5 Check torques.
- 6 Clean inside and exterior.
- 7 Grease fork.
- 8 Install fork.
- 9 Adjust suspension fork (see Section 6.3.14).

8.5.9 Inspecting the seat post

WARNING

Intoxication from lubrication oil

The lubrication oil for Eightpins seat posts is toxic if touched or inhaled.

- Always wear safety goggles and nitrile gloves when working with lubrication oil.
- Lubricate seat post in the open air or in a wellventilated room only.
- Avoid skin coming into contact with lubrication oil. Wear nitrile gloves when lubricating, cleaning and maintaining the vehicle.
- Use an oil catchment tray under the section where the seat post is serviced.
- 1 Remove seat post from the frame.
- **2** Clean seat post on the inside and outside.
- **3** Examine seat post rack for scratches, cracks and fractures.
- Replace damaged seat post as specified in the parts list.
- 4 Fit seat post as per height specifications in the pedelec pass.

8.5.9.1 Inspecting the carbon seat post

Only applies to pedelecs with this equipment

You need to distinguish between impacts and scratches on the paintwork if the carbon seat post paintwork is damaged.

- Ask customer what caused the damage.
- Examine damage with a magnifying glass to see if fibres are permanently damaged or delamination has taken place.

8.5.9.2 Inspecting and greasing BY.SCHULZ suspension seat post

Only applies to pedelecs with this equipment

- 1 Remove seat post from the frame.
- 2 Remove safety and protective cover.
- 3 Clean seat post on the inside and outside.
- **4** Examine seat post rack for scratches, cracks and fractures.
- Replace damaged seat post as specified in the parts list.
- 5 Lubricate screws in the parallel suspension.
- 6 Reinsert seat post as per height specifications in the pedelec pass. Check screws for correct tightening torques.

Torques G1 M8 seat clamp screw M5 fixing grub screws	20 24 Nm 3 Nm
Torque G2 M6 seat clamp screw M5 fixing grub screws	12 14 Nm 3 Nm

7 Put on safety and protective cover.

8.5.9.3 Inspecting and greasing RS SUNTOUR suspension seat post

Only applies to pedelecs with this equipment

- **1** Remove seat post from the frame.
- 2 Remove safety and protective cover.
- **3** Examine seat post rack for scratches, cracks and fractures.
- ➡ Replace damaged seat post as specified in the parts list.
- ➡ If the paint protection film protecting a child seat is missing or has worn away, affix a new paint protection film.
- **4** Undo preload adjuster and take out steel suspension.
- **5** Clean seat post on inside and outside.
- 6 Grease seat post on inside with SR SUNTOUR grease no. 9170-001.
- 7 Lubricate pressure roller with bicycle chain oil.
- Lubricate articulated joints in parallel suspension with bike chain oil.

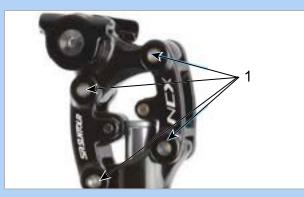

Figure 170: SR SUNTOUR suspension seat post lubrication points

- 8 Reinsert seat post as per height specifications in the pedelec pass.
- 9 Check screws for correct tightening torques.

□ tor Sea	SUNTOUR suspension seat post ues t clamp screw ixing grub screws	15–18 Nm 3 Nm	
--------------	---	------------------	--

10 Put on safety and protective cover.

9 Troubleshooting, fault clearance and repair

9.1 Preventing pain

The pedelec is both a means of transport and a piece of sports equipment that promotes health.

After the first few rides, you may experience sore muscles the next day. However, permanent pain should never occur during or after a ride.

The most common complaints are:

- Sitting discomfort
- Pain in hips
- Backache
- Pain in shoulders and nape of neck
- Numb or aching hands
- Pain in upper thigh
- Pain in the knee
- Pain in the foot

If you suffer from one or more of the complaints above, take the following action steps:

- Check the correct adjustment of all components. In most cases, however, pain after pedelec rides is due to a lack of training and components set incorrectly or components that are not adjusted to the rider's physique.
- 2 Consult a doctor as soon as possible and talk openly about the complaints. Pain may be a sign of medical problems that need to be treated.
- 3 If the doctor does not diagnose a medical condition, visit a gym, sports trainer or physiotherapist. Personalised stretching or musculature strengthening exercises must be supervised to ensure they are performed correctly.

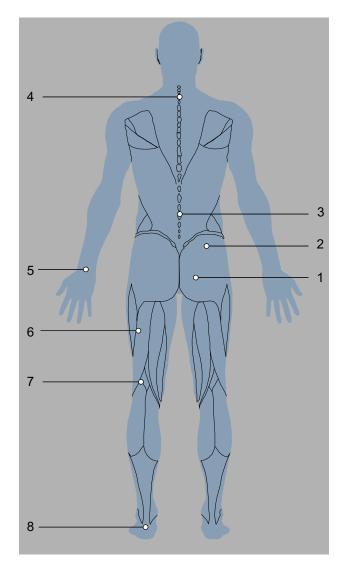

Figure 171: Known pain due to lack of training and/or incorrect component adjustment

9.1.1 Sitting discomfort

Around 50% of all pedelec riders experience sitting discomfort:

- Pressure pain in the sitting bones
- Pain in the lower back
- Pressure pain and numbness in perineal region

Solution

- Adopt an optimal riding position (see Section 6.5.3).
- Adjust the saddle height and tilt (see Section 6.5.4).
- Wear cycling shorts and use chamois cream (see Section 6.12).
- Use an ergonomically adjusted saddle (see Section 6.5.4).

9.1.2 Pain in hips

Lower back pain is often not caused by the back muscles, but by the iliopsoas muscle instead. This muscle is part of the inner hip musculature and flexes the hip. It is attached to the thigh bone and reaches up to the spine. Pain can occur in the back if this muscle is strained too much or shortened.

9.1.3 Backache

Riding a pedelec strengthens the back musculature. The greater the saddle-to-bar drop is, the greater the strain on the back musculature is. At the beginning, a posture where you lean too far forward can lead to pain in the back, arms and wrists. The abdominal muscles are the counterpart to the back muscles and stabilise the pelvis and the back. Back pain is thus often caused by weak abdominal muscles.

Solution

- Strengthening exercises for the iliopsoas muscle.
- Stretching exercises for hip flexors and extensors.

Solution

• Contact specialist dealer. You need to adopt a more upright sitting position (see Section 6.5.3).

Stretching exercises for the back and abdominal muscle ligaments and moderate bicycle training will lengthen the tendons and build new back and abdominal muscles.

The desired position can be adopted after a period of training.

9.1.4 Pain in shoulders and nape of neck

The weight of the upper body places a strain on the shoulders due to the bent-forward posture. The more stretched the position is, the more strain there is on the shoulders.

The specific posture adopted is often the source of pain. Pedelec riders often extend their arms. Impacts such as those occurring on bumpy roads are thus transmitted to the shoulders without suspension. This causes severe pain.

Another source of pain is a hunchback. Due to the posture adopted, the neck needs to be extended backwards excessively so that the rider can look forwards. This causes strain in the neck and shoulder muscles.

9.1.5 Numb or aching hands

Your hands are one of the three points of contact when you ride a pedelec. The hands transmit the weight of the upper body to the handlebars. In the upright Holland position, there is almost no weight applied whereas body weight is at its highest in the sports position. The force is applied to a small area on the handle, meaning the pressure load on the hands is very high. Hands are highly sensitive and can bear a maximum of 20% of body weight during prolonged exposure to load.

9.1.6 Pain in upper thigh

Pain in the upper thigh is usually due to muscular problems. A muscular imbalance between the extensors, flexors and adductors can cause this pain.

Solution

 A more upright riding position will immediately reduce pain. Always bend elbows slightly. ➡ The elbow joint will not block. The arms cushion impacts.
• Adjust the handlebars (see Section 6.5.5)

- Adjust the handlebars (see Section 6.5.5).
- Always adopt an optimal riding position (see Section 6.5.3).

Solution

- Position handles perfectly (see Section 6.5.5.1, 6.5.5.2 and 6.5.8)
- Move hands and arms while riding (see Section 6.15)
- Use padded cycling gloves (see Section 2.15)
- Optimise handles (see Section 6.5.7)

Solution

- Increasing assistance on the pedelec will bring immediate relief.
- Targeted exercises to correct imbalance and shortening of the thigh muscles.
- Stretching exercises for the thigh muscles.

9.1.7 Knee pain

Pedelec riding is a sport that is easy on the knee joints and is recommended for beginners. Very powerful forces are transmitted from the thigh to the foot via the knee when pedalling. As a result, the tendons and cartilage in the knee are subjected to great stress.

Pain on the inside and outside of the knee is often caused by incorrect adjustment of the click system and the foot being out of position as a consequence. Pain in the lower part of the knee usually stems from an improper riding position.

Cold weather can also cause knee pain. Tendons are less elastic at low temperatures and thus rub against the knee more.

If the knee is out of position, the cartilage becomes very worn. Ligaments that are too short or muscular imbalances can increase this effect. Pain on the top of the kneecap often indicates a muscular imbalance. Pain under the kneecap is usually related to excessive pressure in the knee joint and consequential irritation to the patellar tendon.

9.1.8 Pain in the foot

Your feet are one of three points of contact when you ride a pedelec. Feet transmit force from the upper thigh to the pedal, thus driving the pedelec. In the process, your feet are subjected to between 100% and, during jumps, even up to 1,000% of your body weight.

Foot pain often arises when the saddle is too low or the foot is placed incorrectly on the pedal.

Unsuitable shoes can also be the cause of pain in the feet.

Solution

- Contact specialist dealer. Have the pedelec adjusted (see Section 6.5). Then measure the wheel.
- Avoid cold.

Get imbalances under control through stretching exercises, strengthening the muscles and Blackroll training.

Solution

- Wear sturdy shoes which are not too tightly laced (see Section 2.5).
- Position feet correctly on the pedals (see Section 6.13).
- Adjust the saddle height to an optimum position (see Section 6.5.4).

9.2 Troubleshooting and fault clearance

The control panel indicates whether a critical or less critical error has arisen in the drive system.

The error messages generated by the drive system can be read in the eBike Flow app and by the bicycle dealer.

The rider can use a link in the eBike Flow app to display all information on errors and assistance on eliminating errors.

9.2.1 Drive system or on-board computer does not start up

If the on-board computer and/or the drive system do not start up, proceed as follows:

- 1 Check whether the battery is switched on. If not, start the battery.
- ➡ Contact your specialist dealer if the battery level indicator LEDs do not light up.
- 2 If the LEDs on the Battery Level indicator light up, but the drive system does not start, remove the battery.
- 3 Insert the battery.
- 4 Start the drive system.
- **5** If the drive system does not start up, remove the battery.
- 6 Clean all the contacts with a soft cloth.
- 7 Insert the battery.
- 8 Start the drive system.
- **9** If the drive system does not start up, remove the battery.
- **10** Fully charge the battery.
- 11 Insert the battery.
- 12 Start the drive system.

- **13** If the drive system does not start, press the **On-Off button (control panel)** for at least 8 seconds.
- 14 If the drive system does not start after about 6 seconds, press the On-Off button (control panel) for at least 2 seconds.
- **15** Contact your specialist dealer if the drive system won't start.

9.2.2 Errors in assistance function

Symptom	Cause	Remedy		
Assistance is not	Is the battery charged sufficiently?	1 Check battery is charged.		
available.		2 Recharge the battery if it is almost flat.		
	Is the system switched on?	Press On-Off button (battery).		
		➡ The drive system starts.		
	Is the level of assistance set to [OFF]?	1 Set the assistance mode to a different level of assistance than [OFF].		
		2 Contact your specialist dealer if you still feel that the no assistance is being supplied.		
	The rechargeable battery, on-board computer or assistance switch may be connected incorrectly, or one or more of them may have a problem.	 Contact specialist dealer. 		
	Are the pedals being pushed?	The pedelec is not a motorbike.▶ Push the pedals.		
	Is the speed too high?	The electronic gear assistance is only active up to a maximum speed of 25 km/h.		
		Check on-board computer indicators.		
	Is the lock function activated?	Use suitable on-board computer.		
	The battery may become too hot during rides at high temperatures, up	1 Switch off the drive system.		
	long inclines or when carrying a heavy load for a long time.	2 Leave pedelec to cool down.		
		3 Start the drive system.		
The assisted journey distance is too short.	Is the battery fully charged?	1 Check charge level.		
		2 Recharge the battery if it is almost flat.		
	The battery does not perform as well in winter weather.	This does not indicate a problem.		
	The journey distance can be shorter depending on the road conditions, the gear level and the entire light usage time.	This does not indicate a problem.		
	The battery is a consumable. Repeated charging and long periods of	If the distance covered with a fully charged battery has become shorter, the battery may be affected.		
	use cause the battery to degrade (loss of power).	Replace old battery with new one.		
It is difficult to pedal.	Are the tyres pumped to an adequate pressure?	1 Pump up tyres.		
	Is the level of assistance set to [OFF]?	1 Set level of assistance to [HIGH], [STD], [ECO] or [AUTO].		
		2 Contact your specialist dealer if the pedals are still stiff.		
	Is the battery fully charged?	1 Check charge level.		
		2 Recharge the battery if it is almost flat.		
	Have you switched on the system with your foot on the pedal?	 Switch system on again without applying pressure to the pedal. 		
		2 Contact your specialist dealer if the pedals are still stiff.		

Table 53: Error solution for assistance system

9.2.3 Battery errors

Symptom	Cause	Remedy
The battery discharges very quickly.	The battery may be at the end of its useful life.	 Replace old battery with new one.
The battery cannot be	Is the charger mains plug firmly	1 Disconnect the charger mains plug and plug it in again.
recharged.	connected to the socket?	2 Start charging.
		3 If the battery still won't recharge, contact your specialist dealer.
	Is the charger plug firmly connected to batterv?	1 Disconnect the charger plug and plug it in again.
	Dattery	2 Start charging.
		3 If the battery still won't recharge, contact your specialist dealer.
	Is the adapter firmly connected to the charger plug or the battery's charging port?	1 Connect the adapter firmly to the charger plug or the battery charging port.
		2 Start charging.
		3 If the battery still won't recharge, contact your specialist dealer.
	Is the connection terminal for the	1 Wipe with a dry cloth to clean the connection terminals.
	charger, charger adapter or batteries dirty?	2 Start charging.
		3 If the battery still won't recharge, contact your specialist dealer.
The battery does not start charging when the charger is connected.	The battery may be at the end of its useful life.	 Replace old battery with new one.
The battery and charger	Has the battery or charger temperature exceeded the operating temperature range?	1 Interrupt charging process.
become hot.		2 Leave battery and charger to cool down.
		3 Start charging.
		➡ If the battery becomes too hot to touch, there might be a problem with the battery.
		4 Contact specialist dealer.
The charger is hot.	If the charger is used continuously to	1 Interrupt charging process.
	charge batteries, it may become hot.	2 Leave charger to cool down.
		3 Start charging.
The LED on the charger does not light up.	The LED on the charger will go out when the battery is fully charged.	This is not a malfunction.
	Is the charger plug firmly connected to	1 Check connection for any contaminants.
	battery?	2 Insert charger plug.
		3 If the battery still won't recharge, contact your specialist dealer.
	Is the battery fully charged?	1 Disconnect charger mains plug.
		2 Insert mains plug again.
		3 Start charging.
		4 Contact your specialist dealer if the LED on the charger still doesn't light up.
The battery cannot be removed.		 Contact specialist dealer.
The battery cannot be inserted.		 Contact specialist dealer.
Fluid is leaking from the battery.		 Observe all the warnings in Section 2 Safety.

Table 54: Error solution for battery

Symptom	Cause	Remedy		
There is an unusual		1 Remove from the battery immediately.		
smell.		2 Contact the fire service immediately.		
		3 Observe all the warnings in Section 2 Safety.		
Fumes are emitted from		1 Remove from the battery immediately.		
the battery.		2 Contact the fire service immediately.		
		3 Observe all the warnings in Section 2 Safety.		

Table 54: Error solution for battery

9.2.4 Errors on the control panel

Symptom	Cause	Remedy
No data are shown on the control panel if you press the On-Off button	The battery charge level may be insufficient.	 Charge the battery. Switch on the power.
(battery).	Is the power switched on?	Press the On-Off button (battery) to switch the power on.
	Is the battery charged?	If the battery is fitted to the pedelec and is being charged, it cannot be switched on.► Interrupt charging.
	Is the connector fitted to the power cable correctly?	 Check whether the connector is fitted to the power cable correctly. If the connector is fitted correctly, contact your specialist dealer.
	A component may be connected which the system is unable to recognise.	 Contact specialist dealer.
The lock function cannot be set up or switched off.	It may be a firmware error.	 Contact specialist dealer.
The connect account has been deleted or deactivated and the lock function is still activated.		 Contact specialist dealer.

Table 55: On-board computer error solution

9.2.5 Lighting does not work

Symptom	Cause	Remedy	
Front lamp or rear lamp does not go on, even when the switch is pressed.	The default settings in the electric drive system have probably been configured incorrectly.		
The light is defective.			

Table 56: Lighting error solution

9.2.6 Problems with disc brakes

Symptom	Cause	Remedy			
Ringing and unusual sounds from the disc brake.	Riding on tarmac with off-road tyres.	 Contact specialist dealer. Fit a city or trekking tyre. 			
	Dirty or greasy brake disc.	Clean brake disc thoroughly with white spirit or brake cleaner.			
Low braking power from	Worn brake disc.	 Contact specialist dealer. New brake disc. 			
the disc brake.	Worn brake lining.	Contact specialist dealer. New brake linings.			
	Brake lining vitrification.	Contact specialist dealer. New brake linings.			
Metallic noises from disc brake.	Worn brake linings.	 Contact specialist dealer. New brake linings and brake disc. 			
Spongy, soft or poor pressure point in disc brakes.	Brake calliper fitted incorrectly, brake disc loose, brake disc or brake lining worn or brake system leaking	 Contact specialist dealer. 			
	Dirt.	1 Clean brake disc and brake thoroughly.			
		2 If the problem is not solved, contact your specialist dealer.			
	Worn or incorrect brake linings.	• Contact specialist dealer. New brake linings and brake discs.			
	Wheel, hub or axle fitted incorrectly.	 Contact specialist dealer. Check brake system and wheel 			
Noises when a disc brake	Brake calliper and/or brake disc fitted incorrectly.	assembly.			
is applied.	Incorrect torques.				
	Brake disc damaged by side impact.				
	Vitrified brake linings.				
	Brake system leaking.				
	Incorrect brake mount height.				

Table 57: Disc brake error solution

9.2.7 Problems with freewheel

Symptom	Cause	Remedy
	Cover forgotten after fitting.	 Contact specialist dealer. Check installation correct.
Freewheel blocked.	After fitting, socket was compressed by over-tightening the quick-release axle.	Contact specialist dealer. Measure the length of the socket. If the socket is shorter than 15.4 mm, replace socket.
	After maintenance: Too much or wrong grease on the toothed discs.	 Contact specialist dealer. Remove hub. Clean and grease toothed disc.
Freewheel does not lock	Toothed discs are worn.	 Contact specialist dealer. Replace toothed disc.
into place or slips.	One or both springs were forgotten after fitting.	 Contact specialist dealer. Check installation correct.
	One or both toothed discs are fitted the wrong way round after assembly.	 Contact specialist dealer. Check installation correct.
	Ball bearings are worn.	 Contact specialist dealer. Replace ball bearings.
Hub has axial clearance.	One or both toothed discs are fitted the wrong way round after assembly.	 Contact specialist dealer. Check installation correct.
	Ball bearings are worn.	 Contact specialist dealer. Replace ball bearings.
Hub is stiff when turned.	Ball bearings have been driven in too firmly after assembly.	 Contact specialist dealer. Check installation correct.
	Installation sequence for ball bearings not observed.	 Contact specialist dealer. Check installation correct.
Hub makes noise.	Ball bearings are worn.	 Contact specialist dealer. Replace ball bearings.
Cassette caused notches on the freewheel body.	Steel cassette works its way into the aluminium bar on the freewheel body.	 Contact specialist dealer. Remove notches on the cassette surface with a file.
Freewheel body is stiff when turned.	Ball bearings in the freewheel body are worn.	 Contact specialist dealer. Replace freewheel body.
Freewheel is too loud or too quiet.	Perception of freewheel noise is subjective. While some pedelec riders prefer loud freewheel noise, others like a quite freewheel more.	This is not a malfunction. The amount of grease between the toothed discs may have an effect on the freewheel noise. Less grease increases freewheel noise but also causes greater wear.

Table 58: Error solution for freewheel

9.2.8 Problem with SR SUNTOUR suspension fork

9.2.8.1 Rebound too fast

The suspension fork rebounds too quickly, producing a "pogo stick" effect, where the wheel lifts from the ground in an uncontrolled way. This impairs traction and control (blue line). Fork head and handlebars are deflected upwards if the wheel bounces back from the ground. Body weight may be thrown up and back in an uncontrolled way (green line).

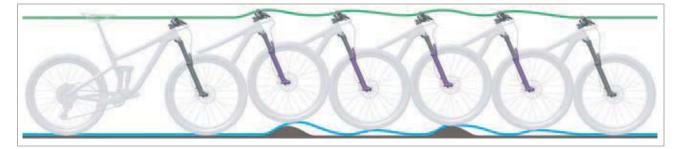

Figure 172: Suspension fork rebounding too quickly

Solution

- ► Turn **rebound screw** in a clockwise direction.
- ➡ The rebound speed is decreased (slower return).

Figure 173: Example of SR SUNTOUR rebound screw (1)

9.2.8.2 Rebounding too slowly

The fork does not rebound quickly enough after absorbing a bump. The fork also remains deflected over subsequent bumps, which reduces deflection and increases the hardness of impacts. Available deflection, traction and control decrease (blue line). The fork remains in a deflected state, causing the headset and handlebars to move to a lower position. Body weight is shifted forward after the impact (green line).

Figure 174: Suspension fork rebounding too slowly

Solution

- ► Turn **rebound screw** in an anti-clockwise direction.
- ➡ The rebound speed is increased (faster return).

Figure 175: Example of SR SUNTOUR rebound screw (1)

9.2.8.3 Suspension too soft on inclines

The fork deflects at a low point in the terrain. The deflection is quickly used up, body weight shifts forward and the pedelec loses some momentum.

Figure 176: Excessively soft suspension in the suspension fork on hilly terrain

Solution

- Turn compression lever clockwise towards LOCK.
- ⇒ The damping and compression hardness are increased and the deflection stroke speed. Efficiency on hilly and flat terrain is improved.

Table 59: Low-speed lever (1) on the SR Suntour suspension fork on the fork crown

9.2.8.4 Excessively hard damping on bumps

When the bike hits a bump, the fork deflects too slowly and the wheel lifts up from the bump. Traction decreases when the wheel no longer touches the ground. The headset and handlebars are deflected upwards significantly, which can impair control.

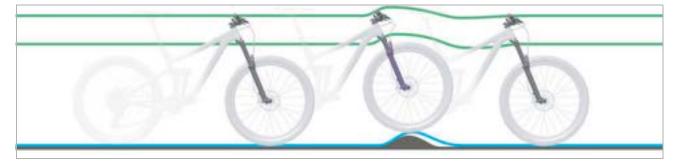

Figure 177: Excessively hard damping in the suspension fork on bumps

Solution

- Turn compression lever clockwise towards OPEN.
- ⇒ The damping and compression hardness reduces and the deflection stroke speed is reduced. Sensitivity to small bumps is increased.

Table 60: Low-speed lever (1) on the SR Suntour suspension fork on the fork crown

9.2.9 Lighting does not work

Symptom	Cause	Remedy	
The front light or rear light does not go on, even when the switch is pressed.	The default settings in the electric drive system have probably been configured incorrectly. The light is defective.	 Take pedelec out of service immediately. Contact specialist dealer. 	

Table 61: Lighting error solution

9.2.10 Problems with the tyres

Symptom	Cause	Remedy	
Valve torn off.	Presta valve used with a sizeable valve hole. The hole's metal edge separates the valve stem from the tube.	 Contact specialist dealer. Fit another type of valve. 	

Table 62: Fault solution for tyres

9.2.11 Problems with the seat post

Symptom	Cause	Remedy
Seat post clicks or creaks.	Protective layer missing.	 Maintain seat post (see Section 7.4.9).
Seat post deflects and bobs periodically.	Incorrect preload.	 Adjust preload so that the suspension seat post does not compress under the rider's weight when at rest.
Seat post with remote control does not rise or lower.	Bowden cable is not tensioned correctly.	 Adjust the Bowden cable with the setting screw (1) on the remote control. Image: Screw (1) on the setting screw (1) on the setting screw (1) Reduce sensitivity: turn the setting screw clockwise. Increase sensitivity: turn setting screw anti-clockwise.

Table 63: Fault solution for the seat post

9.3 Other errors

Symptom	Cause	Remedy
Two beeps will sound if a switch is pressed but the switch cannot be operated.	Pressed switch mode has been deactivated.	This is not a malfunction.
Three beeps are sounded.	A fault or warning has occurred.	This occurs when a warning or an error is shown on the on- board computer. Follow the instructions for the code in Section 6.2 System Messages.
If an electronic gear shift is used, pedal assistance becomes less effective when the gear is changed.	This is because the computer sets the pedal assistance to the optimum level.	This is not a malfunction.
A noise can be heard after switching.		 Contact specialist dealer.
It is normal to hear a noise coming from the rear wheel when cycling as normal.	The gear shift setting may not have been made properly.	 Contact specialist dealer.
If the pedelec is brought to a stop the pedelec, the gear transmission does not switch to the position pre-configured in the functional feature.	You may have applied too much pressure on the pedals.	Press on the pedals only gently to make it easier to change the transmission.

Table 64: Other drive system errors

9.4 Repair

Special expertise and tools are required for many repairs. For this reason, repairs may only be carried out at a specialist dealer. These include:

- · Replacing tyre, tube and spokes
- Replace brake linings, rims and brake discs
- Replace and tension the chain.

9.4.1 Original parts and lubricants

The individual pedelec parts have been carefully selected and matched to one other.

Only original parts and lubricants must be used for inspection and repair.

The constantly updated accessory approval and parts lists are in Section 11, Documents and Drawings.

Follow the operating instructions for the new components.

9.4.2 Repairing the frame

9.4.2.1 Removing paint damage on frame

- **1** Gently sand paintwork damage with 600-grit sandpaper.
- 2 Smooth edges.
- 3 Apply one or two coats of repair paint.
- 9.4.2.2 Removing damage from impact on the carbon frame

There may be damage to the laminate beneath the paintwork in the case of impact. The frame may break even under light stress.

- 1 Take pedelec out of service.
- 2 Send frame to a fibre composite repair company or purchase new frame as specified in the parts list.

9.4.3 Repairing the suspension fork

9.4.3.1 Removing paint damage on the fork

- **1** Gently sand paintwork damage with 600-grit sandpaper.
- 2 Smooth edges.
- 3 Apply one or two coats of repair paint.

9.4.3.2 Removing damage from impact on the carbon frame

There may be damage to the laminate beneath the paintwork in the case of impact. The fork may break even under light stress.

- Take pedelec out of service. New fork as specified in the parts list.
- ⇒ The fork must be free from any defects.
- 4 Clean inside and exterior.
- 5 Grease fork.
- 6 Install fork.

9.4.3.3 Repairing the seat post

Repairing paint damage on the seat post

- **1** Gently sand paintwork damage with 600-grit sandpaper.
- 2 Smooth edges.
- 3 Apply one or two coats of repair paint.
- 9.4.3.4 Repairing damage from impact on the carbon seat post

There may be damage to the laminate beneath the paintwork in the case of impact. The carbon seat post may break even under light stress.

- 1 Take pedelec out of service.
- 2 New carbon seat post as specified in parts list.

9.4.4 Replacing the riding light

Only use components in the corresponding power class for replacement.

9.4.5 Adjusting the headlight

► The *headlight* must be positioned so that its light beam shines on the road 10 m in front of the pedelec (see Section 6.4).

9.4.6 Checking suspension fork-tyre clearance

The tyre clearance needs to be checked each time a suspension fork tyre is replaced.

- 1 Release pressure from the fork.
- 2 Press fork together fully.
- 3 Measure the gap between the top of the tyre and the fork crown's lower surface. The gap must not be less than 10 mm. If the tyre is too large, the tyre will touch the fork crown's lower surface when the fork is fully pressed together.
- 4 Release pressure on fork and pump it up again if it is an air suspension fork.
- **5** Take into account the fact that the gap will be smaller if there is a guard. Check again to ensure that there is sufficient clearance for the tyre.

9.4.7 Replacing pedelec components if lock function is installed

9.4.7.1 Replacing a smartphone

- **1** Install Bosch eBike connect app on the new smartphone.
- **2** Log on using the same account which was used to activate the lock function.
- **3** Connect on-board computer with the smartphone while the on-board computer is in use.
- ⇒ The lock function is shown as set up in the BOSCH eBike Connect app.

9.4.7.2 Replacing the on-board computer

- Connect on-board computer with the smartphone while the on-board computer is in use.
- ⇒ The lock function is shown as set up in the BOSCH eBike Connect app.
- 9.4.7.3 Activating the lock function after motor replacement
- ✓ The lock function is displayed as deactivated in the eBike Connect app when the motor has been replaced.
- 1 Open the <My eBike> menu item in the eBike Connect app.
- 2 Push the <Lock function> slider to the right.
- ⇒ The drive unit assistance can now be deactivated by removing the on-board computer.

10 Recycling and disposal

This device is marked according to the European Directive 2012/19/EU on waste electrical and electronic equipment – WEEE and the European Directive 2006/66/EC on accumulators.

The directive provides the framework for the return and recycling of used devices

across the EU. Consumers are legally required to return all used batteries of any type. It is forbidden to dispose of batteries in domestic waste. The battery manufacturer is legally obliged to take back used and old batteries free of charge according to Section 9 German Batteries Act. The pedelec frame, battery, motor, on-board computer and charger are recyclable materials. You must dispose of and recycle them separately from the domestic waste in compliance with applicable statutory regulations. Separate collection and recycling saves reserves of raw materials and ensures that all the regulations for protection of health and the environment are adhered to when recycling the product and/or the battery.

Never dismantle the pedelec, battery or charger for disposal.

The pedelec, on-board computer, the unopened and undamaged battery and the charger can be returned to any specialist dealer free of charge. Further disposal options may be available, depending on the region.

Store the individual parts of the decommissioned pedelec in a dry place, free from frost, where they are protected from direct sunlight.

10.1 Guidelines on removal of waste

Waste type	Disposal
Non-hazardous waste	
Recycling	
Waste paper, cardboard	Return paper collection bin, paper container, undamaged transport packaging to suppliers
Scrap metal and aluminium	Take to municipal collection points or have collected by waste disposal companies
Tyres, tubes	Tyre manufacturers' collection points, collection forms and fax templates available from tyre manufacturer Otherwise, residual waste bin (grey bin)
Fibre composite components (e.g. carbon, GRP)	Large carbon components such as defective frames and carbon rims can be sent to special collection points for recycling; see www.cfk-recycling.de/index.php?id=57
Dual system sales packaging made of plastic, metal and composite material, lightweight packaging	Collection by waste disposal firm where applicable; return transport packaging to suppliers Plastic waste bin (yellow bin)
CDs, DVDs	Take to municipal collection points since they are made of high-grade plastic and are easy to recycle Otherwise, residual waste bin (grey bin)

Table 65: Removal of waste guidelines

Waste type	Disposal		
Dispose of			
Residual waste	Residual waste bin (grey bin)		
Biodegradable lubricants Biodegradable oils Cleaning cloths covered in biodegradable oil	Residual waste bin (grey bin)		
Filament lamps, halogen lamps	Residual waste bin (grey bin)		
Hazardous waste			
Recycling			
Batteries, rechargeable batteries	Return to the battery manufacturer.		
Electric devices: Motor On-board computer Display Control panel Wiring	Take to a municipal collection point for electronic waste		
Dispose of			
Waste oil Cleaning cloths daubed in oil Lubrication oil Gear oil Lubricating grease Cleaning fluids Kerosene White spirit Hydraulic fluid Brake fluid	Never mix different oil fluids. Store in original container Small amounts (mainly <30 kg) Take to municipal collection points for hazardous waste (e.g. mobile toxic waste collection service) Larger quantities (>30 kg) Collection by waste disposal companies		
Paints Varnishes Thinners	Take to municipal collection points for hazardous waste (e.g. mobile toxic waste collection service)		
Neon lights, energy-saving lamps	Take to municipal collection points for hazardous waste (e.g. mobile toxic waste collection service)		

Table 65: Removal of waste guidelines

11.2 Inspection and maintenance log

Diagnosis and documentation of current status

Date:

Frame number:

Component	Frequency	Description		Criteria		Measures if rejected	
		Inspection	Test		Accept- ance	Rejection	
Front wheel	6 months	Assembly			0.K.	Loose	Adjust quick release
Kickstands	6 months	Check mount fastening	Functional check		О.К.	Loose	Retighten screws
Tyres	6 months		Tyre pressure check		О.К.	Tyre pressure too low/ too high	Adjust tyre pressure
Frame	6 months	Check for damage – fracture, scratches			О.К.	Damage detected	Take pedelec out of service, new frame
Handles, coverings	6 months	Wear; check if fastened securely			О.К.	Not provided	Retighten screws, new handles and coverings as specified in parts list
Handlebars, stem	6 months	Check mount fastening			O.K.	Loose	Retighten screws; new stem as specified in parts list if necessary
Steering headset	6 months	Check for damage	Functional check	Lubricating and adjustment	О.К.	Loose	Retighten screws
Saddle	6 months	Check mount fastening			О.К.	Loose	Retighten screws
Seat post	6 months	Check mount fastening			О.К.	Loose	Retighten screws
Guard	6 months	Check mount fastening			O.K.	Loose	Retighten screws
Pannier rack	6 months	Check mount fastening			О.К.	Loose	Retighten screws
Attachments	6 months	Check mount fastening			О.К.	Loose	Retighten screws
Bell	6 months		Functional check		О.К.	No ring, too quiet, missing	New bell as specified in the parts list
	<u>.</u>		Suspensio	n elements			
Fork, suspension fork	To manu- facturer's specifica- tions*	Check for damage, corrosion, fracture		Maintenance as specified by manufacturer Lubrication, oil change as specified by manufacturer	О.К.	Damage detected	New fork as specified in the parts list
Rear frame damper	To manu- facturer's specifica- tions*	Check for damage, corrosion, fracture		Maintenance as specified by manufacturer Lubrication, oil change as specified by manufacturer	О.К.	Damage detected	New fork as specified in the parts list
Suspension seat post	To manu- facturer's specifica- tions*	Check for damage		Maintenance as specified by manufacturer	О.К.	Damage detected	New fork as specified in the parts list

11.3 Parts list

11.3.1 EVO CX

23-15-2072, 23-15-2073, 23-15-2074 Gent, Trapez, Wave

Frame	PEGASUS, FM-Z-70A23336	Aluminium, welded, frame shape and size: Gent: 45/50/55/60 cm Trapez: 45/50/55/60 cm
Rear frame damper		
Tyres Front Rear	SUPERO, C3031, OPTIMA SAFE	50-622, 28" × 2.00"
Tube	SUPERO, D/V 40 mm	Dunlop valve, valve length: 40 mm for 700 × 50C tyres
Wheel		
Rims	PEGASUS, DDM-2	Aluminium, 700C, 13G × 36H
Spokes		Steel; 14G × 36H/13G × 36H
Spoke nipples		Brass, 14G × 36H / 13G × 36H
Front wheel hub	Bulls, DC-51	front wheel hub, 6-hole mount, with E-Thru quick release axle by fork manufacturer, Aluminium, 14G × 32H Length: 100 mm Axle length: Ø15 mm Weight: 260 g
Rear wheel hub	FORMULA, DC-22RQR	Aluminium, hub gear, 6-hole mount, 13G × 32H
Steering headset	FSA, NO, 57SC	Aluminium, Aheadset, tapered: 1.5", for fork steerer: 1-1/8", 8.4 mm
Stem	KALLOY, AS-ZGD3S	Aluminium, Ahead stem, adjustable, Handlebars clamp diameter: Ø 31.8 mm; stem length: 45/50: 70 mm/55/60: 90 mm Wave frame length: 45/50/55: 70 mm/60: 90 mm
Handlebars	KALLOY, HBRB11	Aluminium, Ø: 31.8 mm; height: 25 mm; backsweep: 9°, Length: Gent: 680 mm/Wave: 660 mm
Handles/tapered Left hand Right hand	VELO ENTERPRISE, VLG-1115AD2	Plastic, 134.5/134.5 mm
Fork	SR SUNTOUR, NEX-E25 DS CTS 15AH2	Steel suspension fork Offset: 44 mm Head tube: 1-1/8"/1.5"to1-1/8" Deflection: 75 mm Right-hand side: NLO Left-hand side: Steel suspension with adjustable preload Fork head: AC4C Brake: Postmount 160 mm Direct/V-brake Head tube: 1-1/8" (TS), STKM/(OP) 1.5"1-1/8" tapered (CTS) STKM Approved: Trekking Axle: Ø: 15-100 Q- LOC system: 15QLC32S/9-100 mm dropout
Fork remote control	SR SUNTOUR, NVX30 NLO DS 29"	
Saddle	VELO ENTERPRISE, Gent: VL-3561/ Lady: VL-6483	

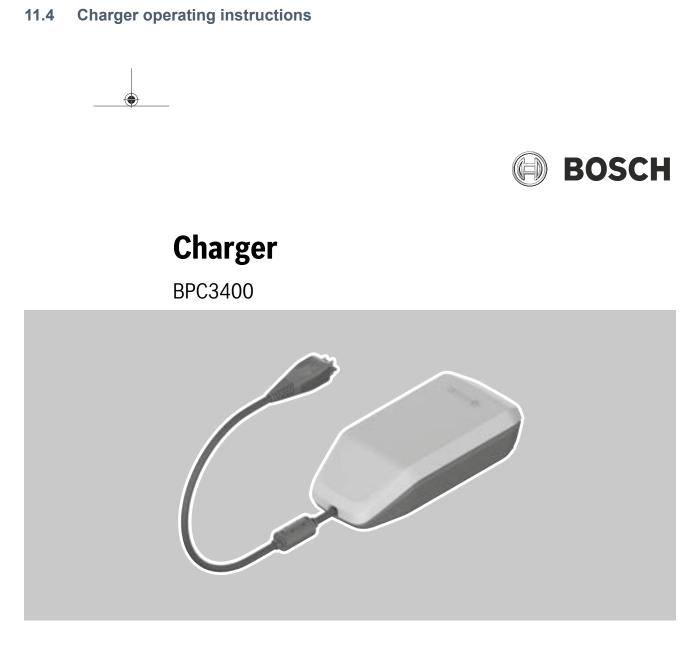

Seat post	KALLOY, SP-368	Aluminium, rider's weight #kg, patent seat post, 2D forged head, 6061-T6 Ø: 31.6 mm Length: 350 mm
Saddle clamp	PEGASUS, XC68C	Aluminium, Ø: 34.9 mm
Pedal	WELLGO, C157	Aluminium/plastic, single pedal with anti-slip, W/9/16", with reflector
Crank set	FSA, CK-220	Aluminium, crank set, Crank length: Length: 170 mm for BOSCH™ Gen3 motors
Chain/belt	#	#
Chain wheel/belt sprocket	SAMOX, EMS05-BHV04	Steel, chain wheel, teeth: 44 T, 3/32" × 44T, for BOSCH™ GEN 4 motors, Plastic chain guard
Chain guard	HORN, CATENA 17	SAMOX, EMS05-BHV04
Chain guide		
Motor	BOSCH™, Performance Line CX (BDU3740)	Mid-drive motor, mass about 2.9 kg Max. torque of 85 Nm j Max. assistance 340% Max. speed: 25 km/h IP protection class IP54 Crank-chainring transmission 1:1 Permitted chainline 47.5 mm 0/+15 mm Chainring support, single, double ISIS crank interface Crank screws M15 x 1 with ISIS crank axle, GEN4/BES3
On-board computer	BOSCH™, LED Remote (BRC3600)	On-board computer, weight: 31 g IP protection class: IP54 Sensors: Brightness sensor Internal battery (type): Li-lon battery, 3.7 V; 75 mAh (replaceable) Typical energy consumption: about 1 W Clamp diameter: 22.2 mm Horizontal adjustment range: Rail 15 mm Communication interfaces: CAN FD, Bluetooth® 5, USB-C® diagnostic interface
Display	BOSCH™, Intuvia 100 (BHU3200)	Width x length x depth 67 x 74 x 18 mm Mass # g IP protection class IP54 Display diagonal length 2.5" Display resolution 240 x 320 Brightness sensor Internal battery CR2450 Typical energy consumption # W Bluetooth® 5 communication interface
	Display mount (BDS3YYY)	Output voltage 4.755.4 V Output current, max. 1.5 A Protection rating IP 54
Control panel		

Rechargeable battery	BOSCH™, PowerTube 500 (BBP375Y) PowerTube 625 (BBP376Y) PowerTube 750 (BBP377Y)	Internal battery, horizontal Length x height x width 345 × 65 × 84 mm Weight 3.0 kg ± 100 g Battery pack 40 10s4p cells Nominal voltage 36 V Nominal current 10 A Max. voltage 42 V Max. current 25 A Nominal capacity 13.4 Ah Energy 500 Wh Length x height x width 415 × 65 × 84 mm Weight 3.65 kg ± 100 g Battery pack 50 10s5p cells Nominal voltage 36 V Nominal current 10 A Max. voltage 42 V Max. current 25 A Nominal capacity 16.7 Ah Energy 625 Wh Length x height x width 484 × 65 × 84 mm Weight 4.3 kg ± 100 g Battery pack 60 10s6p cells Nominal voltage 36 V Nominal current 10 A Max. Voltage 42 V Max. current 25 A Nominal current 10 A Max. Voltage 42 V Max. current 25 A Nominal current 10 A Max. Voltage 42 V Max. current 25 A
Charger	BOSCH™, 4A Charger (BPC3400)	Charger, charging current (max.): 4 A
Brake lever Front Rear	TEKTRO, HD-T280	Brake lever for hydraulic disc brake
Brake Front Rear	TEKTRO, HD-T280	Hydraulic disc brake
Brake disc Front Rear	TEKTRO, W/TR160	Ø 160 mm, 6-hole mount
ABS		
Shifter	SHIMANO Nexus Revo Shifter	Shifter, 2/3 × 9-speed
Rear derailleur	SHIMANO, ALTUS RD-M2000	9-gear
Front derailleur		
Sprocket	SHIMANO, CS-HG200-9, 9-SPD, 11-36T	Cassette sprocket, 9-speed Teeth combination (11-36T): 11-13-15-17-20-23-26-30-36T
Spoke guard		
Headlight	FUXON, FS-50 SL	LED, 6-12 V/DC Max. 50 lx With switch With side light With sensor
Rear light	FUXON, R-232EB	LED, 6–12 V DC With Z-reflector
Reflectors Front Rear Side		
Pannier rack, front		
Pannier rack, rear	STANDWELL, SW-ML079	Aluminium, with MonkeyLoad system
Guard Front Rear	SKS, PET A65 700C	Plastic, 28"
Kickstands	STANDWELL, SW-RA058J	Aluminium
Bell/horn	NUVO, NH-405AP	Bell, aluminium
Mirror		

Battery lock ABUS, BLO ZEG IT4 "EVO IV" X-PLUS		2 keys, with digital key card for ABUS lock	
Chain lock			
Bottle holder	FIDLOCK, BOTTLE CAGE

Bosch eBike Systems

English – **1**

Safety instructions

Read all the safety and general instructions. Failure to observe the safety and general instructions

may result in electric shock, fire and/or serious injury. Save all safety warnings and instructions for future reference.

The term **battery** is used in these instructions to mean all original Bosch eBike rechargeable battery packs.

Do not expose the charger to rain or wet conditions. If water enters a charger, there is a risk of electric shock.

- Charge only Bosch lithium-ion batteries that are approved for use in eBikes. The battery voltage must match the battery charging voltage of the charger. Otherwise there is a danger of fire and explosion.
- Keep the charger clean. Dirt poses a risk of electric shock.
- Always check the charger, cable and plug before use. Stop using the charger if you discover any damage. Do not open the charger. Damaged chargers, cables and plugs increase the risk of electric shock.
- Do not operate the charger on an easily ignited surface (e.g. paper, textiles, etc.) or in a flammable envir-

onment. There is a risk of fire due to the charger heating up during operation.
Take care if you touch the charger while it is charging.

- Fake care if you touch the charger while it is charging. Wear protective gloves. The charger can get very hot, especially when the ambient temperature is high.
- The battery may give off fumes if it becomes damaged or is used incorrectly. Ensure the area is well ventilated and seek medical attention should you experience any adverse effects. The fumes may irritate the respiratory system.
- The eBike battery must not be left unattended while charging.
- Supervise children during use, cleaning and maintenance. This will ensure that children do not play with the charger.
- Children or persons who, owing to their physical, sensory or mental limitations or to their lack of experience or knowledge, are not capable of safely operating the charger may only use this charger under supervision or after having been instructed by a responsible person. Otherwise, there is a danger of operating errors and injuries.
- Read and observe the safety warnings and directions contained in all the eBike system operating instructions and in the operating instructions of your eBike.
- A sticker in English is adhered to the bottom of the charger (marked (4) in the diagram on the graphics page). This says:

Use ONLY with BOSCH lithium-ion rechargeable batteries!

eBike Battery Charger BPC3400 4A Charger EB12.110.001 Input: 220-240 V ~ 50-60 Hz 1.65 A Output: 36 V== 4 A Made in Vietnam Robert Bosch GmbH 72757 Reutlingen, Germany Li-Ion Use ONLY with BOSCH Li-Ion batteries ESV210013 ① 回 🖄 C €

Product description and specifications

Intended Use

In addition to the functions shown here, changes to software relating to troubleshooting and functional modifications may be introduced at any time.

The Bosch eBike chargers are intended exclusively for charging Bosch eBike batteries and must not be used for any other purpose.

Product features

The numbering of the components shown refers to the illustrations on the graphics pages at the beginning of the manual.

Bosch eBike Systems

Individual illustrations in these operating instructions may differ slightly from the actual conditions depending on the equipment of your eBike.

- (1) Battery charger
- (2) Device socket
- (3) Device connector
- (4) Charger safety instructions
- (5) Charging connector
- (6) Socket for charging connector
- (7) Charging socket cover
- (8) Operation/battery charge indicator
- (9) Battery on/off button
- (10) PowerTube

Product code		BPC3400
Rated voltage	٧~	198 to 264
Frequency	Hz	47 to 63
Battery charging voltage	V=	36
Charging current (max.)	Α	4
Charging time for PowerTube 750, approx.	h	6
Operating temperature	°C	0 to 40
Storage temperature	°C	10 to 40
Weight, approx.	kg	0.7
Protection rating		IP40

The specifications apply to a rated voltage [U] of 230 V. These specifications may vary at different voltages and in country-specific models.

Operation

Start-up

Connecting the charger to the mains (see figure A)

Pay attention to the mains voltage. The voltage of the power source must match the voltage specified on the rating plate of the charger. Chargers marked 230 V can also be operated at 220 V.

Plug the device connector (3) of the power cable into the device socket (2) on the charger.

Connect the power cable (country-specific) to the mains.

Charging the removed battery (see figure B)

Switch the battery off and remove it from its holder on the eBike. When doing so, read and observe the operating instructions of the battery.

Ensure the battery is placed on clean surfaces only. Avoid getting dirt, e.g. sand or soil, in the charging socket and contacts in particular.

Plug the charging connector (5) of the charger into the socket (6) on the battery.

Charging the battery on the bike (see figure C)

Switch the battery off. Clean the cover of the charging socket **(7)**. Avoid getting dirt, e.g. sand or soil, in the char-

ging socket and contacts in particular. Lift the cover of the charging socket (7) and plug the charging connector (5) into the charging socket (6).

There is a risk of fire due to the charger heating up during charging. Ensure the battery on the bike is completely dry and placed on a fireproof surface before charging. If this is not possible, remove the battery from the holder and charge it in a more suitable location. When doing so, read and observe the operating instructions of the battery.

Charging process

The charging process begins as soon as the charger is connected to the battery or charging socket on the bike and to the mains.

Note: The charging process is only possible when the temperature of the eBike battery is within the permitted charging temperature range.

Note: The drive unit is deactivated during the charging process.

The battery can be charged with and without the on-board computer. When charging without the on-board computer, the charging procedure can be observed on the battery charge indicator.

When the on-board computer is connected, a charging notification appears on the display.

The state of charge is displayed by the battery charge indicator **(8)** on the battery and by the bars on the on-board computer.

The LEDs on the battery charge indicator **(8)** flash during the charging process. Each solid illuminated LED represents approximately 20 % of the charging capacity. The flashing LED indicates the next 20 % currently charging.

Once the eBike battery is fully charged, the LEDs go out immediately and the on-board computer is switched off. The charging process is terminated. The state of charge can be displayed for **5** seconds by pressing the on/off button **(9)** on the eBike battery.

Disconnect the charger from the mains and the battery from the charger.

When the battery is disconnected from the charger, the battery is automatically switched off.

Note: If you have charged the battery on the bike, carefully close the charging socket (6) with the cover (7) after charging, so that no dirt or water can get in.

If the charger is not disconnected from the battery after charging, after a few hours the charger will switch itself back on, check the state of charge of the battery and begin the charging procedure again if necessary.

Bosch eBike Systems

English – **3**

Errors – causes and corrective measures

Cause	Corrective measures		
	Two LEDs flash on the battery.		
L' Lever L' Lever	Contact an authorised bike dealership.		
Battery defective			
	Three LEDs flash on the battery.		
and the second sec	Disconnect the battery from the charger until the charging temperature range has been reached.		
Battery too warm or too cold	Do not reconnect the battery to the charger until it has reached the correct charging temperature.		
	No LEDs flashing (one or more LEDs will remain perman- ently lit depending on the state of charge of the eBike bat- tery).		
The charger is not charging.	Contact an authorised bike dealership.		
Charging not possible (no indicator on battery)			
Connector not attached properly	Check all connections.		
Battery contacts dirty	Carefully clean the battery contacts.		
Plug socket, cable or charger defective	Check the mains voltage, have the charger checked over by a bike dealership.		
Battery defective	Contact an authorised bike dealership.		

Maintenance and servicing

Maintenance and cleaning

If the charger fails, please contact an authorised bike dealership.

After-sales service and advice on using products

If you have any questions about the eBike system and its components, contact an authorised bicycle dealer. For contact details of authorised bike dealerships, please visit <u>www.bosch-ebike.com</u>.

Disposal

Chargers, accessories and packaging should be recycled in an environmentally friendly manner.

Do not dispose of chargers along with household waste.

Only for EU countries:

According to the European Directive 2012/19/ EU on Waste Electrical and Electronic Equipment and its implementation into national law, chargers that are no longer usable must be collected separately and disposed of in an environmentally friendly manner.

Subject to change without notice.

12 Glossary

Bicycle for young adults

Source: ISO 4210-2: pedelec designed for use on public roads by a young adult whose weight is less than 40 kg, with maximum saddle height of 635 mm or more and less than 750 mm (see ISO 4210).

Brake lever

Source: EN 15194:2017: lever used to apply the brake.

Braking distance

Source: EN 15194:2017: distance travelled by a pedelec between the commencement of braking and the point at which the pedelec comes to rest.

Cargo bike

Source: DIN 79010: pedelec mainly designed to carry goods.

CE marking

Source: Directive on Machinery: the manufacturer uses the CE marking to declare that the pedelec complies with the applicable requirements.

City and trekking bicycles

Source: EN-ISO 4210 - 2: pedelec designed for use on public roads primarily for means of transportation or leisure.

Consumables

Source: EN 82079-1: any part or material that is needed to continue using or maintain the product.

Continuous power rating

Source: ISO 15194:2017, output power specified by the manufacturer at which the motor reaches its thermal equilibrium under the specified ambient conditions.

Decommissioning

Source: DIN 31051: intentional, unlimited interruption in an object's functional capability.

Disc brake

Source: EN 15194:2017: brake in which brake pads are used to grip the lateral faces of a thin disc attached to or incorporated into the wheel hub.

Drive belt

Source: EN 15194:2017: seamless ring belt which is used as a means of transmitting drive force.

Electrical control system

Source: EN 15194:2017: electronic and/or electrical component or an assembly of components provided for installation into a vehicle, together with all electrical connections and associated wiring for the motor electrical power assistance.

Electrically power assisted cycle, bicycle

Source: EN 15194:2017: electrically power assisted cycle pedelec EPAC bicycles, equipped with pedals and an auxiliary electric motor, which cannot be propelled exclusively by means of the auxiliary electric motor, except in start-up assistance mode.

Emergency stop

Source: ISO 13850:2015, function or signal, designed: — to avert arising or reduce existing hazards to persons, damage to machinery or to work in progress; – to be initiated by a single human action.

Fault

Source: EN 13306:2018-02, 6.1: state of an item (4.2.1) characterized by its inability to perform a required function (4.5.1), excluding such inability during preventive maintenance or other scheduled actions or due to lack of external resources.

Folding bicycle

Source: ISO 4210-2: pedelec designed to fold into a compact form, making it easy to transport and store.

Fork steerer

Source: EN 15194:2017: part of a fork that rotates around the steering axis of a pedelec frame head tube. It is normally connected to the fork crown or directly to the fork legs, and is normally the point of connection between the fork and the handlebar stem.

Fracture

Source: EN 15194:2017: unintentional separation into two or more parts.

Maintenance

Source: DIN 31051: maintenance is generally performed at regular intervals and often carried out by trained technical staff. This ensures a maximum service life and low wear and tear for the maintained items. Proper maintenance is often also a pre-requisite for providing a warranty.

Manufacturer

Source: Directive 2006/42/EC on

Machinery, *17.05.2006* Any natural or legal person who designs and/or manufactures machinery or partly completed machinery covered by this Directive and is responsible for the conformity of the machinery or the partly completed machinery with this Directive with a view to its being placed on the market, under his own name or trademark or for his own use.

Maximum continuous power rating

Source: ZEG: the maximum continuous power rating is the maximum power for the electric motor output shaft during 30 minutes.

Maximum permitted total weight

Source: EN 15194:2017: weight of the fully assembled pedelec plus the rider and baggage, as specified by the manufacturer.

Maximum saddle height

Source: EN 15194:2017: vertical distance from the ground to the point where the top of the seat surface is intersected by the seat-post axis, measured with the saddle in a horizontal position and with the seat-post set to the minimum insertion-depth mark.

Maximum tyre pressure

Source: EN 15194:2017: maximum tyre pressure recommended by the tyre or rim manufacturer for a safe and efficient performance. If the rim and tyre both indicate a maximum tyre pressure, the maximum inflation pressure is the lower of the two pressures indicated.

Minimum insertion depth

Source: EN 15194:2017: mark indicating the minimum insertion depth of handlebar stem into fork steerer (fork stem) or seat post into frame.

Model year

Source: ZEG: the model year refers to the first production year that the series-manufactured pedelec was manufactured in the version in question and is not always identical with the year of manufacture. The year of manufacture may be before the model year in some cases. If no technical modifications are introduced to the series, production may continue of pedelecs from a previous model year.

Mountain bike, MTB

Source: ISO 4210 - 2: pedelec designed for use off-road on rough terrain, on public roads, and on public pathways, equipped with a suitably strengthened frame and other components, and, typically, with wide-section tyres with coarse tread patterns and a wide range of transmission gears.

Negative deflection

Negative deflection or sag is fork compression caused by body weight and gear (e.g. a backpack), the rider's position and the frame geometry.

Off-road rough terrain

Source: EN 15194:2017: rough gravel tracks, forest trails and other generally off-road tracks where tree roots and rocks are likely to be encountered.

Operating instructions

Source: ISO/DIS 20607:2018: part of the user information that machine manufacturers provide to machine operators; it contains guidance, instructions and tips related to the use of the machine in all its life cycle phases.

Placing on the market

Source: Directive 2006/42/EC on Machinery, 17.05.2006, Making available for the first time in the Community machinery or partly completed machinery with a view to distribution or use, whether for reward or free of charge.

Pressure point

Source: ZEG the pressure point on a brake is the point on the brake lever where the brake disc and brake pads respond and the braking process is initiated.

Quick-release device, quick release

Source: EN 15194:2017: lever actuated mechanism that connects, retains or secures a wheel or any other component.

Racing bicycle

Source: ISO 4210-2: bicycle intended for highspeed amateur use on public roads and having a steering assembly with multiple grip positions (allowing for an aerodynamic posture), a multispeed transmission system, tyre width not greater than 28 mm and a maximum mass of 12 kg for the fully assembled bicycle.

Rebound

The rebound defines the speed at which the fork rebounds after being loaded.

Rechargeable battery, battery

Source: DIN 40729:1985-05: a rechargeable battery is an energy storage device that can store supplied electrical energy as chemical energy (charging) and release it as electrical energy when required (discharging).

Seat post

Source: EN 15194:2017: component that clamps the saddle (with a bolt or assembly) and connects it to the frame.

Shut-off speed

Source: EN 15194:2017: speed reached, by the pedelec, at the moment the current has dropped to zero or to the no load current value.

Slippage

Source: DIN 75204-1:1992-05: the difference in relation to vehicle speed between the vehicle speed and the speed of its wheels at their circumference.

Spare part

Source: EN 13306:2018-02, 3.5: item intended to replace a corresponding item in order to retain or maintain the original required function of the item.

Suspension fork

Source: EN 15194:2017: front wheel fork incorporating controlled, axial flexibility to reduce the transmission of road-shocks to the rider.

Suspension frame

Source: EN 15194:2017: frame incorporating controlled, vertical flexibility to reduce the transmission of road-shocks to the rider.

Total deflection

Source: Benny Wilbers, Werner Koch: Neue Fahrwerkstechnik im Detail (New chassis technology in detail): The distance that the wheel travels between an unloaded and a loaded position is called total deflection. When at rest, the vehicle's mass is applied to the springs and reduces the total deflection by the *negative deflection* to the positive deflection.

Wear

Source: DIN 31051: reduction in useful life (4.3.4), caused by chemical and/or physical processes.

Weight of the ready-to-ride pedelec

Source: ZEG: the indicated weight for a ready-toride pedelec refers to the weight of a pedelec at the time of sale. The weight of each additional accessory must be added to this weight

Wheel

Source: ISO 4210 - 2: unit or combination of hub, rim and spokes or disc, but excluding tyre assembly.

Work environment

Source: ISO 9000:2015: set of conditions under which work is performed.

Year of manufacture

Source: ZEG: the year of manufacture is the year in which the pedelec was manufactured. The production period is always from May to July the following year.

12.1 Abbreviations

Abbreviation	Meaning/derivation
ABS	Anti-blocking system
EPAC	Electric power assisted cycle
PTW	Permitted total weight

Table 66: Table of abbreviations

12.2 Simplified terms

The following terms are used for better legibility:

Term	Meaning
Operating instructions	Original operating instructions
Damper	Rear frame damper
Specialist dealer	Bicycle specialist dealer
Motor	Drive motor, sub-system
Belt drive	Toothed belt drive

Table 67: Table of simplified terms

13 Appendix

I. Translation of the original EC/EU Declaration of Conformity

Manufacturer

ZEG Zweirad-Einkaufs-Genossenschaft eG Longericher Str. 2 50739 Köln, Germany Authorised representative for documentation* Janine Otto c/o ZEG Zweirad-Einkaufs-Genossenschaft eG Longericher Str. 2 50739 Köln, Germany

The machine, pedelec types:

23-15-2072	EVO CX (Gent)	City and trekking bicycle
23-15-2073	EVO CX (Trapez)	City and trekking bicycle
23-15-2074	EVO CX (Wave)	City and trekking bicycle

Year of manufacture 2022 and year of manufacture 2023, complies with the following applicable EU provisions:

- Machinery Directive 2006/42/EC
- RoHS Directive 2011/65/EU
- Electromagnetic Compatibility Directive 2014/30/EU.

The safety objectives in the Low Voltage Directive 2014/35/EU have been met in compliance with Appendix I, No. 1.5.1 of the Machinery Directive 2006/42/EC.

The following harmonised standards have been applied:

- ISO 20607:2018 Safety machinery Instruction handbook General drafting principles
- EN 15194:2017 Cycles Electrically power assisted cycles EPAC Bicycles

The following other technical standards have been applied:

- EN 11243:2016: Cycles Pannier racks for bicycles Requirements and test methods
- EN 62133-2:2017 Secondary cells and batteries containing alkaline or other non-acid electrolytes. Safety
 requirements for portable sealed secondary cells, and for batteries made from them, for use in portable
 applications
 - Part 2: Lithium systems

CE

Cologne, 02/05/2022
